Andrew Jackson Building | 502 Deaderick Street, Floor 9 | Nashville, TN 37243-0860 615-741-2056 tn.aging@tn.gov | Visit us at www.tn.gov/aging.

The Tennessee Commission on Aging and Disability (TCAD) is pleased to present The State of Aging in Tennessee: A County-ByCounty Snapshot. This report includes county-by-county data on issues affecting older adults in Tennessee.

TCAD's core function is to protect and ensure the quality of life and independence of older Tennesseans and adults with disabilities. The agency pursues data-driven advocacy of policies and programs that improve outcomes for those specific groups while also providing assistance to concerned families and caregivers.

Each data page in the 2018 edition presents county-level data specific to adults ages 65 and older. Each page also includes the projected population growth of seniors in that county over the next fifteen years. Additionally, this year's report features a concluding page of statewide information, numbers for the state as a whole.

This report can be used as a tool to gauge each county's strengths and challenges. Strengths demonstrate success in promoting health and wellness, while challenges are opportunities for improvement. Supporting a call to action, the 2018 County-By-County Snapshot illustrates what we can do to create healthier counties for Tennessee's older adults.

The data presented in this report will also be available on TCAD's website (www.tn.gov/aging) following publication of the printed and bound report, allowing it to be accessed and shared by service providers, advocates, and decision-makers across the state.

Tennessee's population is trending older, adding new challenges to those already known. This report will help you visualize the changes ahead, then begin planning to meet future needs. With your help and the help of our partners, TCAD will continue its effort to make Tennessee a happy and healthy place for older adults to call home.

## Chronic Conditions

Chronic conditions are those that last more than a year, including physical diseases and mental conditions. Compared with other individuals, those with three or more chronic conditions have higher healthcare costs and live 5.3 fewer years [11].

Lifestyle factors such as tobacco use, insufficient physical activity, poor diet, and excessive alcohol consumption contribute significantly to chronic conditions.

Chronic conditions for this measure include Alzheimer's Disease and related dementia, heart failure, arthritis, hepatitis, asthma, HIV/AIDS, atrial fibrillation, high cholesterol, autism spectrum disorder, high blood pressure, cancer, ischemic heart disease, chronic kidney disease, osteoporosis, chronic obstructive pulmonary disease, schizophrenia and other psychotic disorders, depression, stroke, and diabetes.

Data for this measure are based on enrollment and claims data for Medicare fee-for-service beneficiaries from 2007 to 2015 [13].

## Demographic Data

Demographic contained within this document are used for informational purposes to provide a broad overview of some of the characteristics of our communities' older adults. Data sources include the Boyd Center for Business \& Economic Research, [4] the Tennessee Comptroller of the Treasury [5], the Centers for Medicaid and Medicare Services [6], and the United States Census Bureau [3, 7, 8, 19]

## Diabetes Management

Diabetes monitoring is the percentage of diabetic Medicare patients ages 65-75 whose blood sugar control was monitored in the past year using a test of their hemoglobin A1c, or just "A1C" (ey-one-see), levels.

Regular HbA1c monitoring among diabetic patients is considered the standard of care. It helps assess the management of diabetes over the long term by providing an estimate of how well a patient has managed his or her diabetes over the past two to three months.

Evidence suggests that implementing disease management programs that target multiple components of chronic diseases can improve quality of care. The use of HbA1c testing to measure glycated hemoglobin for long-term monitoring of diabetes is widely accepted as one component of a comprehensive disease management program. HbA1c testing is recommended for all patients as part of the initial assessment after a diabetes diagnosis, and then on a routine basis as a part of the patient's comprehensive diabetes care plan. Widespread acceptance of the HbA1c test as a standard component of competent diabetes care makes it an ideal indicator to estimate quality of care.

Data for this measure originate from the Dartmouth Health Atlas Measures of Regional and Racial Variation in Primary Care and the Quality of Care among Medicare Beneficiaries [18].

## Falls

Falls are the leading cause of fatal and nonfatal injuries in adults ages 65 and older. Such injuries may limit mobility, contribute to social isolation, and even cause premature death. The risk of falls and related injuries increases with age and is greatest after age 75. The Healthy People 2020 goal is 4.7\% or fewer adults ages 65 and older having falls that result in an emergency department visit [15]. However, Tennessee has not yet reached this goal as approximately $7.3 \%$ of older Tennesseans had an emergency department visit due to a fall during 2015.

The data shown for this measure are from the Hospital Discharge Data System as retrieved from the Tennessee Department of Health, Division of Policy, Planning and Assessment, Office of Health Statistics [12]

## Flu Shots

The influenza (flu) vaccine helps protect individuals against seasonal influenza virus, a contagious respiratory infection that can worsen long-term health problems and lead to complications such as pneumonia. Older adults are strongly encouraged to get vaccinated, as they are at an increased risk of contracting the virus and may suffer serious symptoms if infected. In fact, it is estimated that older adults account for between $71 \%$ and $85 \%$ of flu-related deaths and more than half of flu-related hospitalizations [11]. Many of these cases can be prevented with the influenza vaccine. Medicare and other insurances cover the full cost of one flu vaccination each year.

Data for this measure are based on claims only for Medicare fee-for-service (FFS) beneficiaries ages 65 and older between August 2016 and July 2017 [14].

## Food Environment Index

The Food Environment Index ranges from 0 (worst) to 10 (best) and equally weights two indicators of the food environment:

1) Limited access to healthy foods estimates the percentage of the population that is low income and does not live close to a grocery store. Living close to a grocery store is defined differently in rural and nonrural areas; in rural areas, it means living less than 10 miles from a grocery store whereas in nonrural areas, it means less than 1 mile. "Low income" is defined as having an annual family income of less than or equal to 200 percent of the federal poverty threshold for the family size.
2) Food insecurity estimates the percentage of the population who did not have access to a reliable source of food during the past year. A two-stage fixed effects model was created using information from the Community Population Survey, Bureau of Labor Statistics, and American Community Survey. Data for this measure comes from the County Health Rankings food environment index. [20]

## Housing-Cost Burdened

Housing is the single largest expense for older adults. Households that spend more than 30 percent of their income on housing are described as "housing-cost burdened." Every additional dollar spent on housing costs and utilities takes away money from other needs such as food, health care, and transportation. This measure is an indicator for households that own and does not include renters, as over 80\% of older Tennesseans are homeowners, with or without a mortgage. However, renters in this same age group tend to fare worse than owners. Being housing-cost burdened presents a particular problem for older Americans, who are more likely to be struggling to make ends meet.

Data for this measure comes from the 2011-2015 data for the American Community Survey 5-year estimates. [3]

## Potentially Preventable Hospital Admissions

Potentially preventable hospitalizations are hospital separations where the principal diagnosis of the hospitalization is thought to be avoidable if timely and adequate non-hospital care had been provided. This refers to preventive measures or early diagnosis and treatment in primary care. Data on avoidable hospitalizations are increasingly used internationally as an indicator of access to healthcare and its effectiveness.

Data for this measure come from Atom Alliance. [17]

## Poverty

Many seniors live on limited incomes and modest savings.
Many individuals, especially those below 100\% of the federal poverty limit, may struggle with the costs of housing and health care, healthy food, and reliable transportation.
Poverty rates among older adults increase with age.
Data for this measure comes from the 2011-2015 data for the American Community Survey 5-year estimates. [1]
