1.0 Introduction

In 2007, the U.S Environmental Protection Agency EPA) finalized amendments to the ambient air monitoring regulations. These amendments revised the technical requirements for certain types of monitoring site, programs and analyzers. Monitoring agencies are required to submit annual monitoring network plans. Knox County Air Quality is a local monitoring agency operating under a certificate of exemption from the State of Tennessee. The regulations from title 40, part 58, Section 10(1) of the Code of Federal Regulations state that: (40 CFR 58.10 (a)(1))

The state, or where applicable local, agency shall adopt and submit to the Regional Administrator an annual monitoring network plan which shall provide for the establishment and maintenance of an air quality surveillance system that consists of a network of SLAMS monitoring stations including FRM, FEM, and ARM monitors that are part of SLAMS, NCore stations, STN, State speciation stations, SPM stations, and/or in serious, sever and extreme ozone nonattainment areas, PAMS stations, and SPM monitoring stations. The plan shall include a statement of purposes for each monitor and evidence that siting and operation of each monitor meets the requirements of appendices A, C, D and E of this part, where applicable. The annual monitoring network plan must be made available for public inspection for at least 30 days prior to submission to EPA.

This document is prepared and submitted to fulfill the requirements of the annual monitoring plan (AMP), as well as provide opportunity for the Knox County Department of Air Quality (Knox County Air Quality) to solicit, evaluate and respond to comments and input from the State of Tennessee Department of Environment and Conservation Division of Air Pollution Control (TDEC-APC) and the general public regarding the network. This comprehensive review serves to evaluate whether the current monitoring strategies are meeting the needs of the County, to determine compliance with all current Federal, State, and Local regulations and to aid in the development of future strategies and decisions. It also serves to identify and report the needs for changes within the network and request approval for those changes from US EPA Regional Office

1.1 Scope and Organization

Knox County Air Quality operates five locations where ambient air quality is routinely measured for air pollutants. The measured data provide the public with information on the status of the air quality. Health researchers, business interests, and others can use the data.

As required by the CFR, this document includes equipment, which have federal reference methods (FRM) or federal equivalent methods (FEM) designations. The terms FRM and FEM denote monitoring instruments that produce measurements of the ambient pollution concentrations that regulations allow to be compared to the national ambient air quality standards (NAAQS) for regulatory purposes. Also included is information regarding non-regulatory and non-criteria pollutant monitoring.

1.2 Description of Monitoring

The criteria pollutants consist of ozone (O₃), nitrogen dioxide (NO₂), Carbon monoxide (CO), Sulfur dioxide (SO₂), lead (Pb) and particulate matter (PM). Knox County operates monitoring stations for Ozone, Particulate Matter, and Lead. Knox County operates an additional EPA monitoring program for the Chemical Speciation Network (CSN).

The ambient air monitoring network is designed by considering several criteria which meet the monitoring objectives. The primary monitoring objective are monitoring compliance with the NAAQS and providing data to the public regarding in a timely manner. Logistics to be considered in design and

June 27,2021 Page 5 of 61

continuation of a site include:

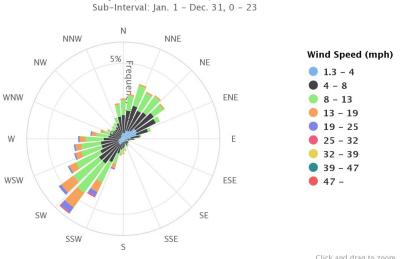

- Safety, security, and accessibility
- Cost of site, relocation, maintenance, e.g. fencing, roads, vegetation clearing
- Level footprint for shelter, platforms or concrete pads •
- Availability of power and communications •
- Meeting pollutant specific location objectives
- Funding •
- Staffing •
- Proximity to other monitors and statistical relevance of data

1.3 Climate and Topography

Knox County is located within the Great Valley of East Tennessee. It is paralleled with an elevated plateau to the west and the Great Smoky Mountains to the east. The valley, characterized by long, narrow ridges, flanked by broad valleys, contains slops from 700 to 1, 500 feet above sea level. The highest peak is 2,064 ft above sea level located in the northeast quadrant. This topography is relevant in monitoring plants due to the influence on inversion events. Additionally, topography can drive pollutant levels with considerations of contributors and recipients of transport pollutants.

Knox County temperatures fall within the humid subtropical climate zone. Temperature is variable due to elevation between valleys and peaks as well as the surrounding plateau and mountains. In the valley summers are hot and humid, with the average high temperature in July of 88° F. East Tennessee averages cooler than Middle or West Tennessee. The average January low is 28 ° F. The average precipitation for the year is 57 inches with 51 inches of rain and 6 inches of snow. Weather data gathered from the National Oceanic and Atmospheric Administration (NOAA).

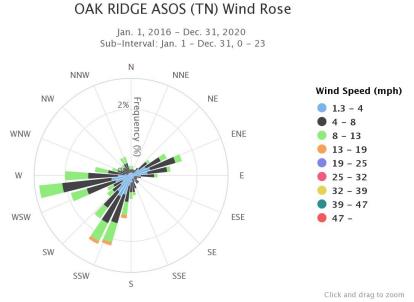

The wind rose for the last five years indicates the winds continue to alternate between blowing from the southwest to blowing from the northeast. Figures 1.1 and 1.2 below are windrose run at the Knoxville McGhee Tyson Airport located in Blount County, and the Oak Ridge location in Anderson County. Each of these locations are located within the Knoxville metropolitan statistical area. Wind rose developed using the cli-MATE tools provided by the Midwestern Regional Climate Center.

KNOXVILLE MCGHEE TYSON AP (TN) Wind Rose Jan. 1, 2016 - Dec. 31, 2020

Figure 1.1 Wind Rose Knoxville

Click and drag to zoom

1.4 Population

The population for Knox County has been increasing, with a variable growth rate around 0.70%. Air monitoring network design considers two different population data metrics. The Core Based Statistical Area (CBSA) and the Metropolitan Statistical Area (MSA). The Knoxville CBSA, defined by the Office of Management and Budget, consists of Anderson, Blount, Campbell, Grainger, Knox, Loudon, Morgan, Roane and Union Counties. The Knoxville MSA was updated in 2013 to include the same 9 counties in the CBSA. Knox County Air Quality works in conjunction with the State of Tennessee for meeting the area monitoring objectives.

Table 1.3 below details the estimated population change over the 2015-2019. The American Community Survey and the Population Estimate Program, both part of the US Census Bureau, perform population estimates. The 2020 full census data will not be released until after the submittal of this document due to delays as a result of COVID-19 pandemic.

Geographic Area	April 1,	2010		Populatio	on Estimat	es (July 1)	
	Census	Estimates	2015	2016	2017	2018	2019
Anderson County,	75,129	75,082	75,456	75,528	76,056	76,287	76,978

Table 1.3 Population Estimates

2.0 Monitoring Network

The term 'ambient air' is defined in 40 CFR 50.1 as "that portion of the atmosphere, external to buildings, to which the general public has access." Federal rules implemented by the USEPA require each state to establish a network of monitors to measure concentrations of criteria pollutants in ambient air based upon population, regional air quality, and regulatory concerns. There are 6 monitoring sites operated in Knox County that collect criteria pollutant data. (Table 2.1 and Figure 2.2).

Station Name	Address	Latitude/Longitude	AQS ID
Air Lab	939 Stewart St	35.980756,-83.925802	47-093-1013
Ameristeel	1526 New York Ave	35.98102,-83.9544	47-093-0023
Burnside	2522 Burnside St	35.98306,-83.9523	47-093-0027
East Knox	9315 Rutledge Pike	36.0855,-83.7649	47-093-0021
Rule	1613 Vermont Ave	35.97773,-83.9504	47-093-1017
Springhill	4711 Mildred Dr.	36.01914,-83.8739	47-093-1020

Table 2.1 Station Identification

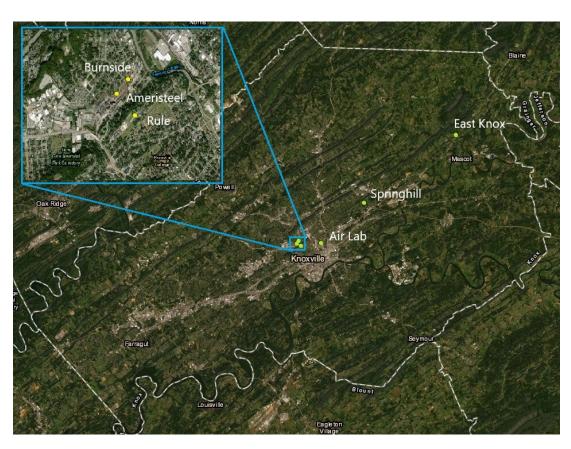

Figure 2.2 Satellite View of Monitoring Stations

2.1 Ozone (O₃) Monitoring

Ambient level ozone is sampled on a continuous basis from March – October at 2 sites in Knox county and referenced to the NAAQS ozone standard. The minimum number of ozone monitors required by 40 CFR Part 58, appendix D is summarized in Table 2.3 below.

	Number of Monitors per MSA			
Metropolitan Statistical Area (MSA) population ^(2,3)	Most recent 3 year design value ≥85% of NAAQS ⁽⁴⁾	Most Recent 3 year design value <85% of NAAQS ^(4,5)		
>10 million	4	2		
4-10 million	3	1		
350,000- < 4 million	2	1		
50,000-349,999 ⁽⁶⁾	1	0		

Table 2.3 Minimum O₃ Requirements ⁽¹⁾

(1) From table D-2 of Appendix D to 40 CFR Part 58

(2) Minimum monitoring requirements apply to the (MSA)

(3) Population based on latest available census figures.

(4) O3 NAAQS levels are defined in 40 CFR part 50

(5) Minimum monitoring requirements apply in absence of a design value

(6) MSA defined as urbanized area of 50,000 or more population.

According to the 2010 Census and the extrapolated US Census Bureau's Population Estimate Program, the Knoxville MSA falls within the 350,000-<4million population category. Knox County operates ozone monitoring sites at Springhill Elementary (47-093-1020) and East Knox Elementary (47-093-0021). Table 2.4 summarizes the 8-hour O₃ values measured at the monitoring sites during the designated ozone season (March-October) of 2020. 2020 saw continued reduction O₃ values. The Springhill 2020 Design Value has dropped below 85% of the NAAQS.

Table 2.4 Ozone Concentrations 2020

	Concentrations			Design Value	NAAQS	Is Design Value
Station	Minimum	Maximum	Average	2020		≥ 85%of NAAQS
East Knox	0.015	0.074	0.041	0.061	0.070	Yes
Springhill	0.007	0.066	0.041	0.058	0.070	No

The monitoring directives in 40 CFR Appendix D Section 5 contain specific requirements for the operation of Photochemical Assessment Monitoring Stations (PAMS) in areas classified as serious, severe, or extreme nonattainment for O_3 . Knox County does not contain any O_3 nonattainment areas, therefore no PAMS monitoring is required in Knox County.

2.2 Carbon Monoxide (CO) Monitoring

Per 40 CFR 58 Appendix D Section 4.2, the requirements for CO monitoring sites are closely related to the requirements for near-road NO2 monitoring sites (see Section 2.3). Table 2.5 below summarizes the number of required CO monitoring sites. As documented in Section 1.4 of this document, the Knoxville CBSA does not meet the listed criteria, therefore none are required. There are no CO monitors in Knox County Air Quality's monitoring program.

Table 2.5 CO Monitoring Requirements

Criteria	Number of Near-Road CO Monitors Required
CBSA ≥ 1,000,000	One, collocated with an NO2 monitor or in an alternative location approved by the EPA

2.3 Nitrogen Dioxide (NO₂) Monitoring

The minimum number of NO2 monitoring sites required by 40 CFR 58 Appendix D Section 4.3 is summarized in Table 2.6.

Table 2.6 Minimum NO₂ Monitoring Requirements ⁽¹⁾

Requirement Type	Criteria	Minimum Monitors Required
	CBSA Population ≥ 1,000,000	1
Near road	CBSA Population ≥ 2.5 Million	2
	CBSA Population ≥ 1,000,000 and Road Segments with annual average daily traffic counts ≥ 250,000	2
Area- Wide	CBSA Population ≥ 1,000,000	1
Protection of Susceptible and Vulnerable Populations	Any area inside or outside CBSAs	As required by EPA Administrator ⁽²⁾

⁽¹⁾ From 40 CFR 58 Appendix D Section 4.3

⁽²⁾ From 40 CFR 58 Appendix D Section 4.3.4 (b)

As documented in Section 1.4 of this document, the Knoxville CBSA does not meet the listed criteria, therefore none are required. There are no NO₂ monitors in Air Quality's monitoring program.

2.4 Sulfur Dioxide (SO2) Monitoring

The EPA criteria used to determine the numbers of required SO_2 monitors is based upon two metrics: The Core Based Statistical Area (CBSA), and the Population Weighted Emissions Index (PWEI). The emissions are based upon the most current emissions inventory calculations. The largest emission sources for SO_2 in the CBSA lays outside the county. The Knoxville CBSA PWEI can be calculated as follows:

Knoxville CBSA 2019 census estimate: 892,366 2017 SO2 Emissions (tones per year): 3,421.23 PWEI= (892,366*3,421.23)/1,000,000 = 3,053

There are no SO₂ monitors required or located in Knox County.

2.5 Lead (Pb) Monitoring

The lead monitoring design rule in 40 CFR 58 Appendix D Section 4.5 requires monitoring agencies to establish monitoring near industrial facilities that emit more than 0.5 tons per year (tpy) of lead into the atmosphere, and at specified airports. None of the listed airports are located in Knox County, but one facility reports annual lead emissions in excess of the 0.5 tpy emissions threshold. The Commercial Metals Company (CMC) plant (formerly Gerdau) reported total lead emissions of 0.64 tons for calendar year 2020. The value exceeds the 0.5 tpy monitoring threshold. Knox County Air Quality operates 2 lead

monitoring sites surrounding the plant which includes one collocated site. The Ameristeel site (47-093-0023) is the source-oriented site required by the rule. This site was established to provide data at the fence line of the plant. The Burnside site (47-093-0027) contains an official and collocated monitor. It was the source specific monitor until 2011 when replaced by the Ameristeel site. Knox County Air Quality has continued to operate the Burnside site (47-093-0027) for additional population exposure data. Knox County Air Quality, as directed in response to the 2020 Annual Monitoring Plan, is requesting the relocation of the Burnside Site to a new site on Tennessee Ave and moving the collocated monitor to the Ameristeel site. Please refer to section 4.1 for all required documentation.

2.6 Particulate Matter (PM₁₀) Monitoring

The minimum number of PM_{10} monitoring sites required by 40 CFR 58 Appendix D Section 4.6 is shown in Table 2.7.

	Number of Monitors per MSA ⁽¹⁾			
Population Category	High Conc. ⁽²⁾	Medium conc. ⁽³⁾	Low conc. ⁽⁴⁾⁽⁵⁾	
>1,000,000	6 - 10	4 - 8	2 - 4	
500,000 - 1,000,000	4 - 8	2 - 4	1 - 2	
250,000- 500,000	3 - 4	1 - 2	0 - 1	
100,000 - 250,000	1 - 2	0 - 1	0	

Table 2.7 Minimum PM₁₀ Monitoring Requirements ⁽¹⁾

⁽¹⁾ From Table D-4 of Appendix D to 40 CFR Part 58. Selection of urban areas and number of stations per MSA within ranges shown are jointly determined by EPA, TDEC, and Air Quality

 $^{(2)}$ High concentration areas are those for which data exceeds the NAAQS by 20 % or more

⁽³⁾ Medium concentration areas are those for which data exceeds 80% of the NAAQS

⁽⁴⁾ Low concentration areas are those for which data is less than 80% of the NAAQS

⁽⁵⁾ Low concentration requirements apply in the absence of a design value.

The Knoxville MSA is a low concentration 500,000-1,000,000 population category requiring 1-2 monitors. Air Quality operates one continuous monitor at the Air Lab site, the APTI-T640x.

2.7 Fine Particulate Matter (PM_{2.5}) Monitoring

The minimum number of $PM_{2.5}$ monitoring sites required by 40 CFR 58 Appendix D Section 4.7 is shown in Table 2.8. In addition to the minimum number of primary monitors required in the network, 40 CFR part 58 appendix A requires

"For each distinct monitoring method designation (FRM or FEM) that a PQAO is using for a primary monitor, the PQAO must have 15 percent of the primary monitors of each method designation collocated (values of 0.5 and greater round up); and have at least one collocated quality control monitor (if the total number of monitors is less than three). The first collocated monitor must be a designated FRM monitor"

Table 2.8 Minimum PM2.5 Monitoring Requirements (1)

	Number of Monitors per MSA			
MSA Population ⁽²⁾	Most recent 3 year design value ≥ 85% of any PM _{2.5} NAAQS ⁽³⁾	Most recent 3-year design value < 85% of any PM _{2.5} NAAQS ⁽³⁾		
> 1,000,000	3	2		
500,000 - 1,000,000	2	1		
50,000 -<500,000	1	0		

⁽¹⁾ From Table D-5 of appendix D to 40 CFR Part 58.

⁽²⁾ Population based on latest available census figures.

⁽³⁾ Minimum monitoring requirements apply in absence of design value

The NAQQS primary standard for the annual mean and the 24-hour average is taken from a 3-year average Based upon the population data and most recent design values, the Knoxville MSA is required to operate 1 primary and 1 collocated PM_{2.5} monitors. Air Quality operates 5 SLAMS monitors which include 3 primary monitors (all continuous method) and 2 collocated FRM monitors. One of the continuous monitors is also used for Air Quality Index (AQI) reporting. Table 2.9 gives the 2020 design values by site.

Table 2.9 PM_{2.5} NAAQS Comparisons

Site	NAAQS Design Values(µg/m ³)		
Sile	24 hour	Annual	
Air Lab	15	8.0	
Rule	18	8.1	
Springhill	15	7.2	

Additionally, Section 4.7.2 of 40 CFR Part 58 Appendix D requires that agencies operate continuous analyzers in at least one-half of the required PM_{2.5} monitoring sites and at least one analyzer per MSA must be collocated with a sequential Federal Reference Method (FRM) analyzer. All primary monitors in the network are continuous analyzers. The monitors at Rule and Air Lab are both collocated.

2.8 Chemical Speciation

The PM_{2.5} monitoring criteria in 40 CFR 58 Appendix D Section 4.7.4 requires that each state continue to conduct PM_{2.5} Chemical Speciation monitoring at locations designated to be part of the National Speciation Trends Network (STN). Air Quality operates one of these speciation sites at Springhill Elementary (47-093-1020).

2.9 National Core Monitoring

Section 3 of Appendix D to 40 CFR part 58 requires that each state operate at least one NCore multipollutant monitoring site. By definition, each NCore site must include monitoring equipment to measure $PM_{2.5}$, $PM_{10-2.5}$, speciated $PM_{2.5}$, O_3 , SO_2 , CO, NO, NOx, lead, and basic meteorology. Knox County is not a chosen NCore site within the State of Tennessee.

3.0 Monitoring Sites

The following section shall detail in the individual sites within the monitoring network, including location, equipment, pollutants monitored and most recent siting evaluation.

3.1 Air Lab

Figure 3.1 Air Lab Site Photo

The Air Lab site is a particulate site, located in the city limits of Knoxville, in a mixed-use zoning area. It is surrounded by residential and commercial facilities. The Teledyne T640X light scattering monitor is used for reporting the Air Quality Index (AQI).

3.3 Burnside

Figure 3.11 Burnside Site Photo

The Burnside site is in the Urban Industrial section of the city of Knoxville. The site was established in 1994 and serve as a source-oriented lead monitor and collocated monitoring site. The Ameristeel Site is now the source-oriented monitor and the Burnside site serves as a population exposure site. This site is requested to be relocated to Tennessee Ave and collocation moved to Ameristeel site.

Figure 3.35 Page 4 Proposed Site Evaluation

4.0 Proposed Changes

The EPA Region 4 governing authority approves Knox County's distribution of monitors and the location of the collocated sites for compliance with Federal regulations. Any changes will be undertaken in partnership and direct advisement with the EPA (and TDEC, when applicable). Before decommissioning any SLAMS monitor, Knox County Air Quality will follow the procedure listed in 40 CFR Part 58.14, "System Modifications". Any proposed changes to the air monitoring network will be documented in the Annual Network Plan.

Changes to the monitoring network may occur outside the Annual Monitoring Plan (AMP) and planning process due to unforeseen circumstances resulting from eviction or other situations that occur after the AMP has been posted for public inspection and approved by the EPA Regional Administrators. Any changes to the network due to circumstances beyond Knox County Air Quality's control will be communicated in writing to the EPA Regional Authority, (and TDEC authorities, when applicable), and identified in the subsequent Annual Monitoring Plan.

4.1 Decommission and Relocations

According to 40 CFR 58.14 (c))(1) a monitor can be removed (after Regional Administrator approval) if it is currently in attainment with the applicable NAAQS standard and if the following four tests can be met:

- 1. The PM2.5, ozone, carbon monoxide (CO), PM10, sulfate dioxide (SO2), lead, or nitrogen dioxide (NO2) monitor showed attainment during the previous five years.
- 2. The probability is less than 10% that the monitor will exceed 80% of the applicable NAAQS during the next three years based on the concentrations, trends, and variability observed in the past.
- 3. The monitor is not specifically required by an attainment plan or maintenance plan.
- 4. The monitor is not the last monitor in a nonattainment area or maintenance area that contains a contingency measure triggered by an air quality concentration in the latest attainment or maintenance plan adopted by the state and approved by EPA.

To conservatively demonstrate test 2, Air Quality shall use the equation:

$$X + \frac{t * s}{\sqrt{n}} < 0.8 * NAAQS$$

Where X is the average design value for a minimum of 5 years, t is the t value for n-1 degrees of freedom at the 90% confidence level, s is the standard deviation of the design values, n is the number of design values, and NAAQS is the standard of interest.

4.1.1 Burnside Collocated Sampler Relocation Request

Knox County Air Quality is requesting the relocation of the quality assurance collocated sampler to the Ameristeel site (47-093-0023) located on New York Avenue. The current location only produced 8 out of 55 sample values that were above the 0.02 μ g/m³ minimum for comparability in CY 2020. Knox County requests to immediately, upon approval of this plan, relocate the collocated monitor to the Ameristeel Site.

4.1.2 Burnside Site Decommission and New Site Location Proposal

Knox County Air Quality requested to discontinue the Burnside lead monitor (47-093-0027) in the 2020 Annual Network Plan. That request was denied, and EPA requested that Knox County Air Quality establish a new site prior to removal of the Burnside lead monitor. That new site was directed to be to the southeast side of the Commercial Metals Company Steel US Plant based on the results of air dispersion modeling found in Appendix B Model Report – CMC Steel USA, LLC Fence Line PB Monitoring Modeling.

Using the model outputs, the receptors sites around the facility were ranked using the methodology provided by EPA. This is included in the Model Report in Appendix B. The methodology took into account the number of months that site had the highest predicted Pb concentration, the number of 3-month periods that the site had the highest predicted Pb Concentration, and each site's overall highest 3-month predicted Pb concentration. The current Pb monitoring site at 1526 New York Avenue (47-93-0023 Ameristeel site) was one of two receptors ranked 20th. The 20 highest ranked receptor sites were located along the southern and northeastern fence line of the facility. Figure 3 of Appendix B Model Report – CMC Steel USA, LLC depicts the ranked site locations.

Knox County Air Quality attempted to contact the property owners of all the receptor sites and adjacent properties along the southern fence line of the facility to locate a Pb air monitor. Table 4.1 lists the properties Air Quality contacted along with the closest receptor site ranking, ownership type and reason the monitor was not sited prior to obtaining 1904 Tennessee Ave (see section 4.1.2.1 below).

Receptor Site Rank(s)	Property	Reason Monitor not sited	Type of Ownership
1,6,7,9,11,12,13 and 18	1943 Tennessee Ave (Fence line and locations on source property)	Denied access by property owner	Private Business
2,3,5 and 8	1919 Tennessee Ave	Denied access by property owner	Private Business
4,14,15 and 16	1536 New York Ave (fence line)	Denied access by property owner	Private Business
10	1916 and 1924 Tennessee Ave	Could not obtain permission from property owner	Private Business
17	1900, 1930 and 1934 Tennessee Ave	Could not obtain permission from property owner	Private residence
19 1734,1738,1742 and 1746		Could not obtain permission from property owner	Private Residence

Table 4.1 Disqualified Site Locations

4.1.2.1 New Site Location Approval Request

Through the site selection process described in section 4.1.2 above, the property owner located at 1904 Tennessee Avenue was contacted. It is located across the street from the 3rd ranked receptor site, and between the receptor sites ranked 10th and 17th on the southeast side of Tennessee Ave. As the property is located between receptor sites ranked higher than the current Ameristeel (47-093-0023) monitoring site and on the southeast side of Commercial Metals Company Steel US Plant, Knox County acquired

this property on May 10, 2021. Figure 4.2 below illustrates the air monitoring locations in relation to the Commercial Metals Company Steel US Plant. Marker 1 is the Ameristeel monitoring site (the current source-oriented site). Marker 2 is the Burnside monitoring site (being requested for decommission). Marker 3 is the proposed Parton Place monitoring site for a special purpose monitoring study.

Figure 4.2 Lead Monitoring Existing and Proposed Site Locations

The new monitoring site, Parton Place, will be classified as a special purpose monitor (SPM) to establish if it or the Ameristeel monitoring site is the site of maximum Pb concentration. Knox County Air Quality will then request that only the site of maximum Pb concentration be operated as the required source-oriented monitor. Upon approval of the site location Knox County will begin surveying, clearing, and constructing the proposed monitoring site with a goal to commence monitoring in November of 2021.

Knox County Air Quality will gather a minimum of 12 months of 3-month rolling averages (15 months of data) and then conduct an analysis to compare the data from the new monitoring site with the Ameristeel (47-093-0023) monitoring site (current source-oriented monitor) to determine the maximum concentration site. This data analysis will be presented along with a request to establish the primary SLAMS monitor at the maximum concentration site in a subsequent Annual Monitoring Plan, expected in July of 2023.

4.1.2.2 Siting Criteria Waiver Request

Lead (Pb) is an elemental heavy metal that can be released directly into the air as suspended particles during manufacturing process. As a heavy metal, it settles quickly out of the air into soil or dust. The aerodynamics of this settling increases the priority in microscale source-oriented monitoring at a site in direct line with the source.

The recently acquired property is 25 feet wide and 144 feet long, with a sloping terrain. The expected probe height will be between 2 and 5 meters from site ground level, which is elevated some from street level. The final establishment of probe height will be determined after the property is properly surveyed and vegetation cleared. The final height will provide the greatest amount of unrestricted airflow and clear line of site to the source property. See Section 3.7 of this document for the initial site assessment of the proposed site.

Knox County Air Quality requests a waiver from EPA for the siting requirement in 40 CFR Part 58 Appendix E stating, "Must have unrestricted airflow 270 degrees around the probe for sampler; 180 degrees if probe is on the side of a building or wall." The property has several large trees on the south and the eastern side that Knox County Air Quality feels confident can be trimmed to meet the 10 meter drip line requirement, but still create an obstruction as the monitor cannot be located a distance 2 times the difference in height.

40 CFR Part 58 Appendix E section 10 states, in pertinent part, "*The EPA will consider a written request from the State agency to waive one or more siting criteria for some monitoring sites providing that the State can adequately demonstrate the need (purpose) for monitoring or establishing a monitoring site at that location.*" Section 4.1.2.1 above describes the property selection process; This is the property Knox County could obtain for siting a monitor located between receptor sites ranked higher than the current Ameristeel (47-093-0023) monitoring site (see Section 4.1.2.1 for the property selection process). The following discussion details the waiver criteria contained in 40 CFR Part 58 Appendix E Section 10.1 and response and evidence from Knox County Air Quality.

40 CFR Part 58 Appendix E Section 10.1 Criteria	Response
10.1.1 The site can be demonstrated to be as	The obstructions are not located
representative of the monitoring area as it would be	between the source and the

The modeling results found in Appendix B of this document support the demonstration that the unobstructed area between the proposed monitoring site and the facility is the area of concern for the highest concentration and, as such, this site would be as representative of the monitoring area as it would be if siting criteria were met. Figure 4.3 below are photos from the proposed site facing the source illustrating the direct line of site.

Figure 4.3 Proposed Site Facing West

physical constraints (e.g., inability to locate the	adjourning properties and,
required type of site the necessary distance from	therefore, Knox County Air
roadways or obstructions).	Quality cannot remove them.

Knox County did an extensive search for locations for monitoring lead based upon the modeling results. This is the only property located between receptor sites ranked higher than the current Ameristeel (47-093-0023) monitoring site that Knox County Air Quality could acquire to monitor Pb on the southeast site of the source. Knox County Air Quality is unable to establish the exact siting of the new monitor placement at this time. However, Air Quality anticipates there will be at minimum 210 degrees of unrestricted airflow and 180 degrees of that is facing the source. Additionally, Knox County will provide the maximum amount of unrestricted air flow that can be safely accomplished by clearing vegetation on the property. Figure 4.4 below shows the current vegetative overgrowth of the property and the arrow represents the approximate location of the monitor.

Figure 4.4 Proposed Site - Parton Place

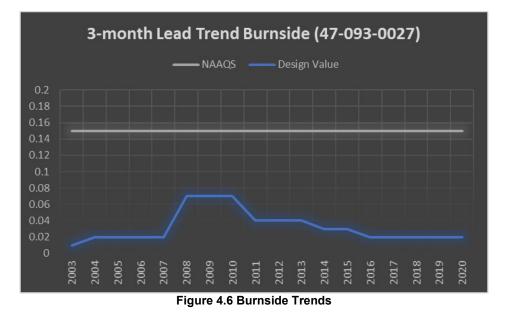

4.1.2.3 Burnside Site Decommission Request

Following the directives of the 2020 AMP response, and approval of this plan, Knox County Air Quality shall decommission the Burnside site upon the commencement of monitoring at Parton Place, the new site established in section 4.1.2. The Burnside site is not required by any attainment or maintenance plan, nor is it the last monitor in a non-attainment or maintenance area. The Burnside site measured levels of lead are less than 50% of the NAAQS. Table 4.5 below demonstrates attainment of standard for the past 5 years and demonstrates a less than 10% probability that the site will come within 80% of the NAAQS. This request follows the EPA provided guidance in the response to the 2020 AMP and 5-year Network Assessment.

Monitor	2016	2017	2018	2019	2020	Avg	Std Dev	n	t	NAAQS	80% of NAAQS	90% upper Cl	Test Pass
Burnside	0.02	0.02	0.02	0.02	0.02	0.02	0	5	2.13	0.15	0.12	0.02	YES

 Table 4.5 Burnside Probability of Exceedance

According to 40 CFR Part 58, Appendix D " Network Design Criteria for Ambient Air Quality Monitoring" Section 4.5, Knox County Air Quality is only required to operate one source specific Lead Monitor. The Burnside site was the original lead site in the monitoring network. In 2011 the Ameristeel source-oriented site was established at the fence line of the source. The Burnside site was maintained to view trends and continue to monitor population exposure. The trends data in figure 4.6 below, shows 19 years of design values under 50% of the NAAQS standard for this site.

The Ameristeel site has 10 years of data illustrating a reduction to below the NAAQS, and continued decline. Figure 4.7 charts the 3 month rolling average design value of each site plotted together. This illustrates the large difference between the source oriented Ameristeel (47-093-0023) site and Burnside (47-093-0027) site. The Burnside site is no longer useful for source monitoring or trends data.

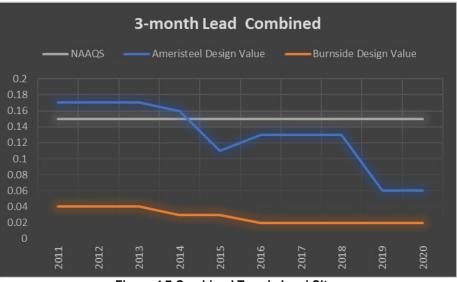

Figure 4.7 Combined Trends Lead Sites

4.2 Replacements and Reassignments

Knox County Air Quality has completed the transition to continuous monitoring in the PM_{2.5} network as approved in the 2020 AMP. There are no changes in methods requested in 2021.

Knox County Air Quality removed the elevated platform at the Ameristeel Site (47-093-0023). This platform was removed due to serious safety issues. Two new platforms have been built in the same location. The new platforms meet the siting criteria in 40 CFR Part 58 Appendix E but the elevation is a lower profile (See Section 3.2). These lower platforms will allow for additional room at the site for the collocated monitor, as well as room for PEP audit equipment for additional quality assurance checks.

Appendix B - Model Report-CMC Steel USA, LLC Fence Line Pb Monitor Modeling

Model Report – CMC Steel USA, LLC Fence Line Pb Monitor Modeling 1919 Tennessee Avenue, Knoxville, TN 37921

May 6, 2019

1.0 Summary

As required by 40 CFR Part 58 Appendix D, the Knox County Department of Air Quality Management (KCDAQM) is required to site a lead (Pb) monitor, taking into account logistics and the potential for population exposure, where the Pb concentration from all sources combined is expected to be at its maximum. The KCDAQM performed an air dispersion modeling analysis to determine the locations of maximum Pb concentrations. The air dispersion modeling analysis was conducted following the guidance obtained from the Environmental Protection Agency (EPA) and contained in the EPA Guideline on Air Quality Models.

2.0 Model Inputs

2.1 Model of Choice/Version

The AERMOD model, version 18081, was used for the air dispersion modeling analysis.

2.2 Description of the Site

The base elevation of the plant is 960 feet (292.6 meters) and was used throughout the modeling. During the modeling review for the Prevention of Significant Deterioration (PSD) Air Permit Application submitted on November 22, 2004, the applicant had used the land use methodology known as the Auer Technique to determine the area was Urban. Therefore, the Urban dispersion coefficient was selected in AERMOD. See Figure 1 below for a scaled facility drawing showing the proximity of the fence line and buildings.

Figure 1: Scaled Facility Drawing

2.3 Emission Sources

The emission of Pb was modeled for three emission sources at the facility. They are baghouse 2, baghouse 4, and the meltshop building louver. All other sources of Pb emissions were considered negligible.

The stacks of baghouses 2 and 4 were inputted into AERMOD as point sources (1 stack for baghouse 4 and 14 stacks for baghouse 2). During the modeling review for the Prevention of Significant Deterioration (PSD) Air Permit

Application submitted on November 22, 2004, the applicant listed the baghouses stack heights and stack diameters. Baghouses 2 and 4 average Pb emissions, temperature, and volumetric flow rate data from stack tests conducted in 2012 and 2015 were used for the emission rate, gas exit temperature, and gas exit flow rate. Since baghouse 2 has 14 stacks and one is always in cleaning mode (i.e., not in operation), one of baghouse 2's stacks (stack 14) emission rate or gas exit flow rate was set to zero with the average Pb emissions and volumetric flow rate, from the stack tests, allocated evenly to the remaining 13 stacks. Lastly, the coordinates of the emissions sources were updated.

The meltshop building louver was inputted into AERMOD as a volume source. The center and half the height of the penthouse were used for the coordinates and release height of the volume source, respectively. The average Pb emission data from the Meltshop Building Louver Study (industrial hygiene/ambient methodology) conducted in 2013 was used for the emission rate.

See Attachment 1 for the AERMOD parameters for baghouse 2, baghouse 4, and the meltshop building louver.

2.4 Downwash Effects

The EPA downwash program called BPIPPRM, dated 04-27-04, was used to calculate the downwash parameters for input to AERMOD. During the modeling review for the Prevention of Significant Deterioration (PSD) Air Permit Application submitted on November 22, 2004, the applicant had determined the building heights. KCDAQM staff updated the building coordinates due to additions to the buildings. See Attachment 2 for the updated building coordinates and heights that were used for input to BPIPPRM.

2.5 Receptors and Complex Terrain

A dense receptor grid was used with 50 meter spacing at the fence line and a Cartesian grid with 50 meter spacing beyond the fence line out to 500 meters. Terrain elevations for all the receptors were imported from AERMAP, version 18081, input data processor using the United States Geological Survey (USGS) 1-degree Digital Elevation Model (DEM) files.

Some of the receptors are located at terrain heights that are greater than the top of the stacks. This terrain is called complex terrain. However, these receptors are not located in areas where the concentrations are highest (i.e., not around the facility boundary). Therefore, no further analysis is required.

2.6 Meteorological Data

The meteorological data input to the AERMOD model consists of the five years of National Weather Service (NWS) data, for years 2014, 2015, 2016, 2017, and 2018. The surface station data is from the Knoxville/McGhee Tyson Airport station (Station No. 13891) and the upper air data is from the Nashville/Metro Airport station (Station No. 13897). The surface station data were processed with the upper air sounding data using AERMET, version 18081, to create the meteorological files for input to AERMOD. Meteorological data for the five years were used for the air dispersion modeling analysis.

3.0 Model Results

The predicted highest 3-month Pb concentrations in Figure 2 show maximum impact areas along the southern and northeastern fence lines of the facility. An analysis of the predicted highest 3-month Pb concentration as well as a ranking system for the monthly and 3-month maximum receptor concentration were utilized according to EPA guidance (see Attachment 3 for e-mail dated 10/9/2018).

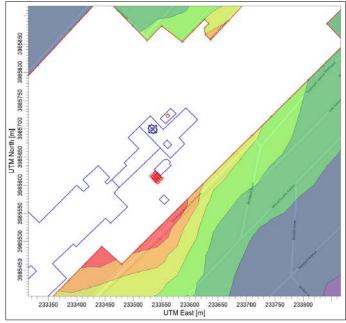

Figure 2: Highest 3-Month Concentrations

The ranking system combined the ranks of each receptor according to the number of months that the receptor had the highest predicted Pb concentration, the number of 3-month periods that receptor had the highest predicted Pb concentration, and each receptor's overall highest 3-month predicted concentration was used to rank proposed sites to locate the Pb monitor. The resulting receptor ranking confirmed that the areas along the southern and northeastern fence lines are the most probable locations for capturing the maximum Pb concentrations at a monitor. Figure 3 shows the location of the top 20 ranked receptors.

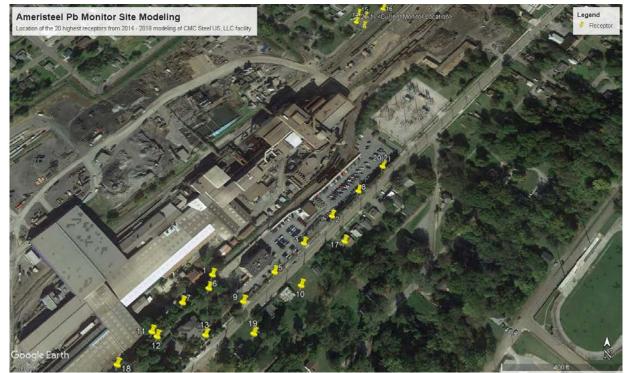

Figure 3: 20 Highest 3-Month Pb Concentration Receptor Sites

Ranking of receptor guidance provided by EPA

From:	Walther, Katherine
To:	Brian Rivera
Cc:	Howard, Chris
Subject:	Knox County Pb Modeling
Date:	Tuesday, October 09, 2018 3:50:35 PM
Attachments:	GerdauExample_KW_Oct2018.xlsx

Hi Brian,

I hope you are doing well! I wanted to let you know that we talked with James Thurman from OAQPS to get his thoughts on how to do the ranking analysis for potential placement of a lead monitor. Would you be available sometime this week to have a call to discuss James' proposed methodology? Additionally, Chris wanted to discuss the model inputs for the volume source (MSLOUV), specifically, the initial vertical dimension (sz) of 0.83 meters.

Below is an outline of James' suggestions for the ranking analysis.

Run AERMOD with monthly output and run LEADPOST to get the rolling 3-month averages at each receptor as well as the maximum rolling 3-month average at each receptor. Then do the following:

- Using the maximum rolling 3-month output from LEADPOST, rank the receptors from highest to lowest design value. Give each receptor a score based on its rank. The highest receptor would have rank of 1. This is analogous to the design value ranking in the SO2 guidance.
- 2. For the monthly output from AERMOD, determine the highest receptor for each month in the modeled period. Total up the number of times each receptor is the highest across the modeled months. For example, a receptor may be the highest for 6 monthly averages across the modeled period, another receptor could be highest 4 times in the modeled period, etc. After getting how many times each receptor is the highest for each month, rank the receptors by the number times each is the highest, ranking from the highest number of months to the lowest number of months. Give each receptor a score, with rank 1 being the receptor having the most number of months where it's the highest across all the receptors. This is analogous to the MAXDAILY analysis in the SO2 guidance.
- Since the design value is a rolling 3-month average, perform a similar analysis as step 2, except do it on the rolling 3-month averages output from LEADPOST. Get a ranking similar to step 2.
- 4. For each receptor, add up the scores from the 3 steps. The lowest score a receptor could have is 3. That would be a receptor that has the highest design value (DV), has the most occurrences of monthly max, and most occurrences of rolling 3-month average max.

I used the initial Pb modeling that you submitted to run through these steps. I have attached that spreadsheet for your reference as an example.

The first sheet, "monthlysorted" lists the AERMOD monthly concentrations sorted by descending concentration for each month with the rank (MONTHRANK). The sheet "monthly_stats" lists the number of times a receptor has an occurrence of a particular monthrank. For example, the first receptor listed has 21 months where it is the highest

receptor for the month. The second receptor listed has the highest monthly concentration 16 times. The highlighted receptors are the ones which are the highest receptor at least one time.

The third sheet, "3monthconc" is similar to "monthlysorted" except it is the rankings for the 3month rolling averages output by LEADPOST. The "3monthconc" sheet has all of the source groups and the "3monthconcALLOnlySrcGrp" has just the "All" source group. The sheet "rolling3monthstats" is similar to "monthlystats" except it is for the rolling 3-month averages. Here there are 4 receptors that were highest for at least one 3-month period.

The sheet "maxconcreceptor" contains the maximum 3-month rolling averages output by LEADPOST, basically the design value. These are sorted by descending concentrations.

The last sheet ("scores") is the score for the receptors where all three datasets: monthlystats, rolling3monthstats, and the sorted design values are merged and scores calculated. I've highlighted six receptors with the lowest scores that had monthcount and count values > 0.

Please let me know if you have any questions regarding the steps outlined in this email. Additionally, at your earliest convenience, please let me know your upcoming availability so we can schedule a call to discuss this. I wanted to provide the steps ahead of time so that you had time to look through the example and see what questions you might have.

Thanks!

Sincerely, Katie

Katie Walther U.S. Environmental Protection Agency, Region 4 Air, Pesticides & Toxics Management Division Air Data & Analysis Section PH: (404) 562-9110

Appendix C Response to Comments

Air Quality received the following comments during the public comment period from May 24, 2021 – June 24 ,2021. Comments are indicated by italic print, and standard type the response.

Comment 1 USEPA Region 4 - Knox County discussed a new monitoring site at Parton Place on Tennessee Ave in "Section 4.0 Proposed Changes." Additional information related to the site selection of Parton Place will need to be provided in the final Annual Network Plan submittal for EPA to be able to approve the site.

- Knox County provided modeling information in "Section 6.0 Model Report-CMC Steel USA, LLC Fence Line Pb Monitor Modeling;" however, an analysis of the rankings and site selection process based on modeling results was not included in the report. This report should explain how the Parton Place location was selected, and why a site with a higher rank could not be established along Tennessee Ave.
- The Proposed Changes section should include the following information:
 - Discussion on what the model outputs show and mean.
 - A narrative description and relevant documentation of your agency's site selection process. This should include any documentation demonstrating how your agency followed the appropriate EPA guidance for selecting a site and your process for looking into several properties by rank. Please discuss why higher ranked sites were not chosen (e.g. access issues). Document the steps Knox County completed to find a suitable monitoring location.
 - Provide a good public record on the thought process for site selection.

: In addition to the above information, please provide:

- A proposed timeframe for installation of the monitor
- A proposed timeframe for data collection
- A discussion on how you will determine which monitor is the maximum concentration monitor, including the minimum timeframe for data collection at both sites
- The expected process of maintaining the maximum concentration monitor as a SLAMS monitor and the request to shut down the lower reading to be included in future annual network plans
- Expected probe height
- It would be useful to include 3.7 Proposed New Site "Parton Place" within the Proposed Changes section rather than splitting the information

As part of the waiver request, please provide a thorough discussion on:

- Explanation of Pb source-oriented monitoring and the importance of collecting data at the highest possible receptor with a clear line of sight of the facility.
 - The expected amount of unrestricted airflow
 - Refer back to the process for securing a suitable property, and provide discussion on if another, more suitable site was not available
 - The narrative text should clearly state if there will be a clear line of sight between the monitor and the facility
 - 40 CFR Part 58 Appendix E 5 (c): "For microscale sites of any air pollutant, no trees or shrubs should be located between the probe and the source under investigation, such as a roadway or a stationary source" and how this applies to your waiver request

For the discontinuation of the Burnside monitor, please provide an updated version (e.g. 2020 data) of Section "4.2.2 Lead" included in the 2020 Annual Network Plan/Assessment. The discussion provided in 2020 Annual Network Plan/Assessment was thorough in explaining the difference between the Ameristeel and Burnside sites, including why Knox Co is requesting to shut down Burnside over the Ameristeel site.

Response to Comment 1: Section 4 of this document has been revised to include the requested information.
