# Executive Summary

Healthcare-associated infections (HAIs) are a major public health problem. According to the Centers for Disease Control and Prevention (CDC), there were an estimated **722,000 HAIs** and **75,000 HAI-related deaths** in the United States in 2011<sup>1</sup>, making HAIs one of the top ten leading causes of death<sup>2</sup>. This report summarizes the performance of Tennessee's acute care hospitals, long-term acute care hospitals and inpatient rehabilitation facilities on five different types of HAIs in 2017 and 2018 and healthcare worker flu vaccination for the 2017/2018 and 2018/2019 flu season.

## Key Findings

### **In 2017, Tennessee hospitals reported:**

- **Fewer** central line-associated bloodstream infections (CLABSI) in adult and pediatric intensive care units (ICUs) and wards than predicted based on the national experience from 2015. **About the same** CLABSI in neonatal ICUs and long-term acute care hospitals (LTAC) than predicted based on the national experience from 2015.
- **Fewer** catheter-associated urinary tract infections (CAUTI) in adult and pediatric ICUs and wards than predicted based on the national experience from 2015. **About the same** CAUTI in LTAC and inpatient rehabilitation facilities (IRF) than predicted based on the national experience from 2015.
- **Fewer** number of surgical site infections (SSI) following colon procedures and **about the same** abdominal hysterectomies as predicted based on the national experience from 2015.
- **More** positive lab results with methicillin-resistant *Staphylococcus aureus* (MRSA) bacteria found in the bloodstream in IRF as predicted based on the national experience from 2015. **About the same** of MRSA positive lab results with MRSA found in the bloodstream in acute care hospitals and LTAC.
- **Fewer** number of positive lab results with *Clostridioides difficile* found in stool (feces) in all facility types than predicted based on the national experience from 2015.
- On average, **89.4%** of the healthcare workers in Tennessee hospitals had documented vaccination for seasonal influenza for the 2017/2018 flu season

---

<sup>1</sup> Magill SS, Edwards JR, Bamberg W, et al. Multistate Point-Prevalence Survey of Health Care-Associated Infections. *New England Journal of Medicine* 2014;370:1198-208.

<sup>2</sup> Kleven RM, Edwards JR, Richards CL, Jr., et al. Estimating health care-associated infections and deaths in U.S. hospitals, 2002. *Public health reports* 2007;122:160-6.

(October 2017-March 2018). On average, **92.7%** of the healthcare workers in LTAC and **91.1%** of healthcare workers in IRF had documented vaccination.

***In 2018, Tennessee hospitals reported:***

- **Fewer** central line-associated bloodstream infections (CLABSI) in adult and pediatric ICUs and wards than predicted based on the national experience from 2015. **About the same** CLABSI in neonatal ICUs and LTAC than predicted based on the national experience from 2015.
- **Fewer** catheter-associated urinary tract infections (CAUTI) in adult and pediatric ICUs and wards than predicted based on the national experience from 2015. **About the same** CAUTI in LTAC and **more** in IRF than predicted based on the national experience from 2015.
- **Fewer** number of surgical site infections (SSI) following colon procedures and **about the same** abdominal hysterectomies as predicted based on the national experience from 2015.
- **More** positive lab results with methicillin-resistant *Staphylococcus aureus* (MRSA) bacteria found in the bloodstream in hospitals as predicted based on the national experience from 2015. **About the same** of MRSA positive lab results with MRSA found in the bloodstream in IRF and LTAC.
- **Fewer** number of positive lab results with *Clostridioides difficile* found in stool (feces) in all facility types than predicted based on the national experience from 2015.
- On average, **90.8%** of the healthcare workers in Tennessee hospitals had documented vaccination for seasonal influenza for the 2018/2019 flu season (October 2018-March 2019). On average, **87.7%** of the healthcare workers in LTAC and **91.4%** of healthcare workers in IRF had documented vaccination.

# Introduction

## ***What is the purpose of this report?***

This report is meant to help patients who need inpatient medical treatments decide whether they should be concerned about healthcare-associated infections (HAIs) at the hospital they may choose. HAIs are infections patients can get while receiving medical treatment in a healthcare facility. Patients should know that these infections are unintended. Ideally, HAIs should never happen, but sometimes they do.

Hospitals track and report HAIs for many reasons. In some cases they are required to do so—either by state public health authorities or by federal health agencies. In most cases, hospitals report numbers (data) about certain HAIs because they want to know how well they are doing in preventing them, and how they compare with other hospitals of similar size and with similar kinds of patients.

It is important for the patients and their family members or advocates using this information to ask healthcare providers questions before seeking and while receiving medical treatment. Asking the right questions can help patients and family members learn what they can do to prevent infections.

### ***This report looks at five HAIs:***

1. Central line-associated bloodstream infections (CLABSI) in adult and pediatric intensive care units (ICUs), neonatal ICUs, and adult and pediatric wards
2. Catheter-associated urinary tract infections (CAUTIs) in adult and pediatric intensive care units (ICUs) and adult and pediatric wards
3. Surgical site infections (SSI) following colon surgeries and abdominal hysterectomy procedures
4. Positive laboratory results with methicillin-resistant *Staphylococcus aureus* (MRSA) bacteria found in the bloodstream
5. Positive laboratory results with *Clostridioides difficile* (*C. difficile*) bacteria found in stool (feces)

*For more information about central lines, urinary catheters, and the HAIs discussed in this report, see [“Fast Facts”](#)*

This report also shares information on healthcare worker vaccination for seasonal influenza (or the “flu”). The Centers for Disease Control and Prevention (CDC) and the Tennessee Department of Health recommend that all personnel who work in a healthcare setting receive the flu vaccine each year to help prevent the spread of flu. See the “[Guide to Understanding Healthcare Worker Influenza Vaccination](#)” for more information.

In addition to the five HAIs and healthcare worker vaccination data shown in this report, hospitals are required by law to report additional HAIs to the Tennessee Department of Health. Information about all HAIs hospitals report to the Tennessee Department of Health and HAI data from other types of healthcare facilities can be found in the technical version of this report. More information about Tennessee’s mandatory reporting requirements and the technical version of the State HAI Report can be found here:

<https://www.tn.gov/health/cedep/hai.html>.

These measures do not represent all possible infections, but were selected because they give a good overview of how a hospital is doing in preventing healthcare-associated infections. These infections are largely preventable when healthcare providers use infection prevention steps recommended by the CDC. The information in this report can help you to think about whether a particular hospital is the best place for you to receive care. However, there are other things to consider when making a decision about where to get your care. You should use this information as a starting point to ask your healthcare provider questions, and use the answers in your decision making. For more things to consider when it comes to choosing a hospital, see “[Things to Think About When Choosing a Healthcare Facility](#).”

*For more information about what patients can do to prevent HAIs, see “[What Patients Can do to Prevent Infections](#)”*

# Methods

## ***How should I read this report?***

This report looks at how hospitals in this state performed in terms of infection prevention by displaying how many HAIs they reported during January 2017-December 2018. It shows whether a hospital had more HAIs, fewer HAIs, or about the same number of HAIs compared to the national baseline (national experience) based on previous years of reported data. This comparison takes into account differences between hospitals such as types of patients and procedures, as well as other factors such as the hospital's size and whether it is affiliated with a medical school. See "[Reading Guide to the HAI Data Tables: An Explanation of Each Variable](#)" for a guide to understanding the data tables presented in this report.

This report also looks at the percentage of all healthcare workers in each hospital who received the flu vaccine. Higher percentages are better, because this indicates that a greater number of healthcare workers are protected against the flu and less likely to spread it to patients. The report shows whether a hospital had a higher percentage, lower percentage, or similar percentage of vaccinated healthcare workers compared to the Department of Health and Human Services (HHS) Healthy People 2020 goal (90%). See "[Reading Guide to the Healthcare Worker Influenza Vaccination Data Tables](#)" for a guide to understanding the healthcare worker flu vaccination data table presented in this report.

## ***What do the Numbers Mean?***

It's important to understand that numbers alone won't show how well a hospital is doing in preventing HAIs. This report shows how hospitals performed during 2017 and 2018 and compares each hospital's performance to the national baseline.

Larger hospitals that see more patients or do more surgeries may have more infections compared to smaller hospitals. Therefore, it is important not only to consider the "interpretation" for each hospital, but to also look at the total number of procedures performed and the total number of infections observed (or identified) in that time period.

## ***If a Hospital Has Zero (0) Infections, What Does That Mean?***

The total number of infections listed in the data tables represents a count of the number of infections reported by this hospital. If the number of infections is zero (0), this means that the hospital saw no infections of this type during 2017 or 2018. It does NOT mean that the hospital

failed to report all of their infections. If a hospital reported zero infections, it may be important to consider the size of the hospital and to look at the total number of procedures performed and the total number of infections that were predicted (also shown in the data tables).

*For more information about how the numbers in this report are calculated, see the Methods section of the [technical report](#).*

### ***Where do the numbers come from?***

Hospitals self-report their HAI data to the CDC and the Tennessee Department of Health using a free, web-based software system called the National Healthcare Safety Network (NHSN). CDC and the Tennessee Department of Health HAI program provide training to hospital staff on the appropriate use of this system and provide guidance on how to track infections in a standard way.

More information about NHSN can be found here: <http://www.cdc.gov/nhsn/>

### ***Things to consider when looking at the report***

A complete list of considerations and limitations of these data can be found in the technical report, available here: <https://www.tn.gov/health/cedep/hai.html>

This report covers data from January 2017-December 2018, and the data were downloaded from the National Healthcare Safety Network (NHSN) on June 20<sup>th</sup>, 2019; any changes made to the data after this date are not reflected in this report. Before reviewing this report, a few clarifications about the data need to be made:

1. ***The data within this report are preliminary.*** The Tennessee Department of Health HAI Program has reviewed the quality of the data to identify any potential errors or data entry mistakes, but these data have not been thoroughly reviewed through external validation. Although efforts were made by hospitals and the Tennessee Department of Health HAI Program to ensure that the data were accurate and complete, the data are self-reported and have not been formally “double-checked,” or validated.

2. ***There may be differences in reporting practices among hospitals.*** Hospitals with more infection control personnel and resources may be able to identify and report more infections compared to a hospital with fewer infection control resources.
3. ***There may be differences between results published by the Tennessee Department of Health and results published elsewhere*** (e.g., CMS - Centers for Medicare and Medicaid Services Hospital Compare website). Results may differ due to using data from different time periods, different facility types, different patient populations, and/or different methods of analysis.
4. ***The Tennessee Department of Health chose not to present some rates*** for individual hospital units, procedures or hospitals that did not meet a threshold (minimum value) for the reporting period. The minimum threshold numbers are based on CDC recommendations for reporting healthcare-associated infection data.
5. ***The Tennessee Department of Health does not calculate an SIR when the number of predicted infections is less than 1.*** In these situations, the “How Does This Facility Compare to the National Experience” text says “No conclusion.” This does not mean that the hospital failed to report data, or that the hospital did not report all necessary data; it only means that the number of patients, devices (central lines or urinary catheters), and/or procedures that were seen at this hospital during this time period did not meet the established threshold (minimum value) for calculating an SIR. This minimum threshold is based on CDC recommendations. In other words, there is not enough information to make a reliable conclusion about this hospital’s performance on this measure.
6. ***Laboratory-Identified Events (LabID Events):*** *Clostridioides difficile* infections (CDI) and methicillin-resistant *Staphylococcus aureus* (MRSA) bacteremia (blood infection) LabID events rely on laboratory data. Patients did not have to be ill to have a positive result, and a positive result can be determined without requiring clinical information about the patient. This allows for a much less labor-intensive means to track CDI and MRSA infections. Only those LabID events that occurred more than 3 calendar days after hospital admission are displayed in this report.

# Results

## ***Reading Guide to the HAI Data Tables: An Explanation of Each Variable***

***Below is a list of all variables shown in the HAI data tables:***

- **Title:** The title of the table gives you information about the infection type, time period, geographic location, and facility type included in the table.
- **Facility Name:** This is the name of the facility. Facilities with multiple campuses will have each campus identified separately.
- **Procedure Type:** This is the specific type of surgery for which the surgical site infection (SSI) data are presented (such as abdominal hysterectomy or colon surgery). If acronyms are used, you can find the full name of the surgery in the legend or in the table's title.
- **Number of Procedures:** This is the total number of surgeries performed by a facility during a single year.
- **Observed Infections (or Observed Events):** This is the number of infections (or events, for LabID measures) that was reported by the facility.
- **Predicted Infections (or Predicted Events):** This is a calculated value that reflects the number of infections (or events, for LabID measures) that we have "predicted" to occur in this facility, based on the national experience.
- **"How Does This Facility Compare to the National Experience?"** Colors and symbols are used to help you quickly understand and interpret the facility's data. This is the "take-home message" about healthcare-associated infections in this facility.

★ **Indicates that the facility had fewer infections than were predicted (better than the national experience)**

= **Indicates that the facility had about the same number of infections as were predicted (same as the national experience)**

✗ **Indicates that the facility had more infections than were predicted (worse than the national experience)**

**No Conclusion:** Indicates that this facility reported data, but there was not enough information to make a reliable comparison to the national experience (number of predicted infections was less than 1).

# CLABSI

*Adult, Pediatric and Neonatal Critical Care Units*

## Central Line-Associated Bloodstream Infections (CLABSI)

A **central line** is a tube placed in a large vein to allow access to the bloodstream and provide the patient with important medicine. A **central line-associated bloodstream infection (CLABSI)** can occur when bacteria or other germs travel along a central line and enter the blood. When not put in correctly or kept clean, central lines can become a pathway for germs to enter the body and cause serious infections in the blood.

CLABSI data are presented for 2017 and 2018 separately for adult and pediatric intensive care units (ICU) and neonatal ICUs (NICU). Burn and trauma ICUs are excluded from the tables below. Only hospitals with eligible intensive care units during 2017 and 2018 are included in the following tables. In the following tables, hospitals are compared to the national experience from 2015 national data used by CDC for comparison.

**Table 1: Central Line-Associated Bloodstream Infections (CLABSI) in Adult and Pediatric ICUs and Neonatal ICUs in Tennessee Hospitals Overall, 01/01/2017 – 12/31/2017**

Location Type	Observed Infections	Predicted Infections	How do Tennessee Hospitals Compare to the National Experience?
Adult/Pediatric ICUs	204	240	★ <b>Better</b>
Neonatal ICUs	41	55	= <b>Same</b>

Comparison to the National Experience	Number of Hospitals	
	Adult/Pediatric ICUs	Neonatal ICUs
★ <b>Better</b>	2	1
= <b>Same</b>	39	11
× <b>Worse</b>	0	0
<b>No Conclusion</b>	45	13

Legend			
★ Fewer infections ( <b>better</b> ) than predicted based on the national experience.*	= About the <b>same</b> number of infections as predicted based on the national experience.*	× More infections ( <b>worse</b> ) than predicted based on the national experience.*	<b>No Conclusion</b> When the number of predicted infections is less than 1, no conclusion can be made.
<b>*National experience contains data from 2015 for CLABSI.</b>			

**Table 2: Central Line-Associated Bloodstream Infections (CLABSI) in Adult and Pediatric ICUs and Neonatal ICUs in Tennessee Hospitals Overall, 01/01/2018 – 12/31/2018**

Location Type	Observed Infections	Predicted Infections	How do Tennessee Hospitals Compare to the National Experience?
Adult/Pediatric ICUs	173	229	★ <b>Better</b>
Neonatal ICUs	42	53	= <b>Same</b>

Comparison to the National Experience	Number of Hospitals	
	Adult/Pediatric ICUs	Neonatal ICUs
★ <b>Better</b>	3	0
= <b>Same</b>	35	11
✗ <b>Worse</b>	1	1
<b>No Conclusion</b>	48	13

Legend			
★ Fewer infections ( <b>better</b> ) than predicted based on the national experience.*	= About the <b>same</b> number of infections as predicted based on the national experience.*	✗ More infections ( <b>worse</b> ) than predicted based on the national experience.*	<b>No Conclusion</b> When the number of predicted infections is less than 1, no conclusion can be made.
<b>*National experience contains data from 2015 for CLABSI.</b>			

**Table 3: Tennessee Central Line-Associated Bloodstream Infection (CLABSI) in Adult and Pediatric Intensive Care Units (ICU) Acute Care Hospital Report, 01/01/2017 - 12/31/2017**

Facility Name	Observed Infections	Predicted Infections	How Does This Facility Compare to the National Experience?
Baptist Memorial Hospital - Collierville	1	Less than 1.0	<b>No Conclusion</b>

# CLABSI

*Adult and Pediatric Medical, Surgical, and Medical/Surgical Wards*

## Central Line-Associated Bloodstream Infections (CLABSI)

CLABSI data are presented for 2017 and 2018 separately for adult and pediatric wards. Only hospitals with eligible Adult and Pediatric Medical, Surgical, and Medical/Surgical Wards during 2017 and 2018 are included in the following tables. In the following tables, hospitals are compared to the national experience from 2015 national data used by CDC for comparison.

**Table 7: Central Line-Associated Bloodstream Infections (CLABSI) in Adult and Pediatric Medical, Surgical, and Medical/Surgical Wards in Tennessee Hospitals Overall, 01/01/2017 – 12/31/2017**

Location Type	Observed Infections	Predicted Infections	How do Tennessee Hospitals Compare to the National Experience?
Adult/Pediatric Wards	152	225	★ Better

Comparison to the National Experience	Number of Hospitals
	Adult/Pediatric Wards
★ Better	7
= Same	35
× Worse	1
No Conclusion	60

Legend			
 Fewer infections ( <b>better</b> ) than predicted based on the 2015 national experience.*	= About the <b>same</b> number of infections as predicted based on the 2015 national experience.*	 More infections ( <b>worse</b> ) than predicted based on the 2015 national experience.*	<b>No Conclusion</b> When the number of predicted infections is less than 1, no conclusion can be made.

# CLABSI

## *Long-term Acute Care Hospitals*

## Central Line-Associated Bloodstream Infections (CLABSI)

CLABSI data are presented for long-term acute care hospitals (LTAC) for 2017 and 2018. LTACs are facilities designed for people that require care on an ongoing basis but no longer require intensive care at an acute care hospital. In the following tables, hospitals are compared to the national experience from 2015 national data used by CDC for comparison.

**Table 11: Central Line-Associated Bloodstream Infections (CLABSI) in Long-Term Acute Care Hospitals in Tennessee Hospitals Overall, 01/01/2017 – 12/31/2017**

Location Type	Observed Infections	Predicted Infections	How do Tennessee Hospitals Compare to the National Experience?
LTAC	49	55	= Same

Comparison to the National Experience	Number of LTACs
★ Better	1

# CAUTI

*Adult and Pediatric Critical Care Units*

## Catheter-Associated Urinary Tract Infections (CAUTI)

A **urinary catheter** is a tube placed in the bladder to drain urine. A **catheter-associated urinary tract infection (CAUTI)** can occur when bacteria or other germs travel along a urinary catheter, resulting in an infection in the bladder or the kidney.

CAUTI data are presented separately for adult/pediatric intensive care units and adult and pediatric medical, surgical, and medical/surgical wards for the years 2017 and 2018. In the following tables, only hospitals with eligible intensive care units during 2017 and 2018 are included in the following tables and are compared to the national experience from 2015, national data used by CDC for comparison.

**Table 15: Catheter-Associated Urinary Tract Infections (CAUTI) in Adult and Pediatric ICUs and Adult and Pediatric Medical, Surgical, and Medical/Surgical Wards in Tennessee Hospitals Overall, 01/01/2017 – 12/31/2017**

# CAUTI

## *Long-term Acute Care Hospitals*

## Catheter-Associated Urinary Tract Infections (CAUTI)

CAUTI data are presented for long-term acute care hospitals (LTAC) for 2017 and 2018. LTACs are facilities designed for people that require care on an ongoing basis but no longer require intensive care at an acute care hospital. In the following tables, hospitals are compared to the national experience from 2015 national data used by CDC for comparison.

**Table 21: Catheter-Associated Urinary Tract Infections (CAUTI) in Long-Term Acute Care Hospitals in Tennessee Overall, 01/01/2017 – 12/31/2017**

# Surgical Site Infections (SSI)

*Colon Procedures and Abdominal Hysterectomy Procedures*

## Surgical Site Infections (SSI)

A **surgical site infection (SSI)** occurs after surgery in the part of the body where the surgery took place. These infections may involve only the skin or may be more serious and involve tissue under the skin or organs. SSIs sometimes take days or months after surgery to develop. Symptoms may include fever, redness or pain around the surgical site, or drainage of fluid from the wound.

Surgical site infections following colon surgeries and abdominal hysterectomy procedures are included in this report for hospitals that performed at least 20 eligible procedures in 2017 and 2018. In the following tables, hospitals are compared to the national experience from 2015 national data used by CDC for comparison.

**Table 29: Surgical Site Infections (SSI) Following Colon Surgeries and Abdominal Hysterectomy Procedures in Tennessee Hospitals Overall, 01/01/2017 – 12/31/2017**

Procedure Type	Number of Procedures	Observed Infections	Predicted Infections	How do Tennessee Hospitals Compare to the National Experience?
Colon Surgery	8,234	180	217	★ Better
Abdominal Hysterectomy	9,169	60	56	= Same

Comparison to the National Experience	Number of Hospitals	
	Colon Surgery	Abdominal Hysterectomy

**Methicillin-Resistant *Staphylococcus aureus* (MRSA)  
Bacteremia Laboratory-Identified Events**

## Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Laboratory-Identified (LabID) Events

**Methicillin-resistant *Staphylococcus aureus* (MRSA)** infections are caused by bacteria that are resistant to certain types of drugs. MRSA can cause skin or wound infections. Sometimes, MRSA can infect the blood and cause serious illness and even death.

Only bloodstream infections are shown in this report from acute care hospitals, long-term acute care hospitals (LTAC) and inpatient rehabilitation facilities (IRF) in 2017 and 2018. In the following tables, hospitals are compared to the national experience from 2015, national data used by CDC for comparison.

**Table : Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Laboratory-Identified (LabID) Events in Tennessee Hospitals Overall, 01/01/2017 – 12/31/2017**

Hospital Type	Observed Events	Predicted Events	How do Tennessee Hospitals Compare to the National Experience?
Acute Care	290	268	= Same
LTAC	27	21	= Same
IRF	14	4	× Worse

Comparison to the National Experience	Number of Hospitals		
	Acute Care	LTAC	IRF
★ Better	2	1	0
= Same	38	5	0
× Worse	5	2	0
No Conclusion	61	1	31

Legend			
 Fewer infections ( <b>better</b> ) than predicted based on the 2015 national experience.	= About the <b>same</b> number of infections as predicted based on the 2015 national experience.	 More infections ( <b>worse</b> ) than predicted based on the 2015 national experience.	<b>No Conclusion</b> When the number of predicted infections is less than 1, no conclusion can be made.

# **Clostridioides difficile Infection (CDI) Laboratory- Identified Events**

## Clostridioides difficile Infection (CDI) Laboratory-Identified (LabID) Events

*Clostridioides difficile* (*C. difficile*) is a type of bacteria that causes severe diarrhea and can be deadly. *C. difficile* infections usually occur in people who have recently taken antibiotics and have been under medical care.

CDI data are shown in this report from acute care hospitals, long-term acute care hospitals (LTAC) and inpatient rehabilitation facilities (IRF) in 2017 and 2018. In the following tables, hospitals are compared to the national experience from 2015, national data used by CDC for comparison

**Table 42: Clostridioides difficile Infection (CDI) Laboratory-Identified (LabID) Events in Tennessee Hospitals Overall, 01/01/2017 - 12/31/2017**

Hospital Type	Observed Events	Predicted Events	How do Tennessee Hospitals Compare to the National Experience?
Acute Care	2,050	2,467	★ Better
LTAC	70	112	★ Better
IRF	72	98	★ Better

Comparison to the National Experience	Number of Hospitals		
	Acute Care	LTAC	IRF
★ Better	29	3	3
= Same	57	6	9

## ***Reading Guide to the Healthcare Worker Influenza Vaccination Data Tables***

- **Title:** The title of the table gives you information about the time period (flu season), geographic location, and facility type(s) included in the table.
- **Facility Name:** This is the name of the facility. Facilities with multiple campuses will have each campus identified separately.
- **Percentage of Healthcare Workers Vaccinated:** This is calculated as a percentage (how many per hundred) of all healthcare workers in the hospital who received the flu vaccine. This includes all facility employees, licensed independent practitioners, adult students, and adult volunteers regardless of full time/part time status, clinical responsibility or patient contact.
- **“How Does This Facility Compare to the Healthy People 2020 Goal”?**
  1. Vaccination is higher (**better**) than the Healthy People 2020 Goal: ★ **better**
  2. Vaccination is **similar** to the Healthy People 2020 Goal: = **same**
  3. Vaccination is lower (**worse**) than the Healthy People 2020 Goal: ✗ **worse**

## Healthcare Worker Influenza Vaccination

Influenza, or “the flu,” is a mild to severe respiratory illness caused by the influenza virus. It is a contagious illness, meaning that it can easily spread from person to person. If healthcare workers (also known as healthcare personnel) become infected with the flu, they can spread this illness to their coworkers and patients. Some patients in a hospital are at high risk for complications from the flu, such as the elderly, very young, or those with severe chronic illnesses. Extra care should be taken to prevent the spread of the flu among healthcare workers and patients.

The best way to prevent the flu is by getting vaccinated. The Centers for Disease Control and Prevention (CDC) recommends that all healthcare personnel who work in a healthcare setting receive the flu vaccine each year to help prevent the spread of flu within the workplace. Healthcare personnel in the following tables include all facility employees, licensed independent practitioners, adult students/trainees, and volunteers regardless of full time/part time status, clinical responsibility or patient contact. Contracted personnel who don't otherwise fit into the categories described are not included in this report.

**Table 56: Tennessee Hospital Healthcare Worker Influenza Vaccination Percentages, 2017/2018 Flu Season\***

Hospital Type	Percentage of Healthcare Workers Vaccinated	How do Tennessee Hospitals Compare to the Healthy People 2020 Goal of 90%?

## **Additional Information for Healthcare Consumers**

# FAST FACTS:

## What You Need to Know About Healthcare-Associated Infections

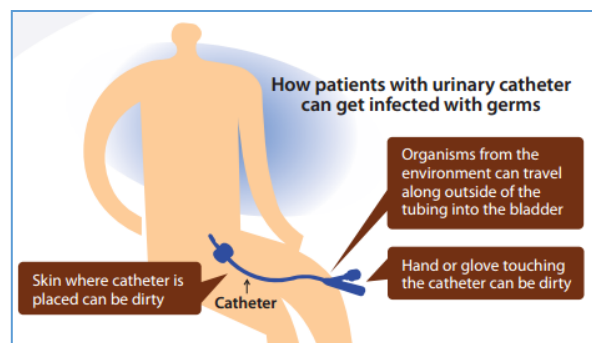

Fast Facts was created with the permission of the Kansas Department of Health and Environment—infographics were taken from their report. Images of MRSA and *C. diff* are from CDC.

- A **surgical site infection (SSI)** occurs after surgery in the part of the body where the surgery took place. These infections may involve only the skin or may be more serious and involve tissue under the skin or organs. SSIs sometimes take days or months after surgery to develop. Symptoms may include fever, redness or pain around the surgical site, or drainage of fluid from the wound.
- **Methicillin-resistant Staphylococcus aureus (MRSA)** infections are caused by bacteria that are resistant to certain types of drugs. MRSA can cause skin or wound infections. Sometimes, MRSA can infect the blood and cause serious illness and even death. Only bloodstream infections are shown in this report.
- **Clostridium difficile (C. difficile)** is a type of bacteria that causes severe diarrhea and can be deadly. *C. difficile* infections usually occur in people who have recently taken antibiotics and have been under medical care.

Sometimes, patients have medical devices inserted into their bodies to provide necessary medical care. These devices are called “invasive devices” and patients with these devices have a higher chance of getting an infection. Here is what you need to know about invasive devices and what kinds of infections they can be associated with:

- A **central line** is a tube placed in a large vein to allow access to the bloodstream and provide the patient with important medicine. A **central line-associated bloodstream infection (CLABSI)** can occur when bacteria or other germs travel along a central line and enter the blood. When not put in correctly or kept clean, central lines can become a pathway for germs to enter the body and cause serious infections in the blood.
- A **urinary catheter** is a tube placed in the bladder to drain urine. A **catheter-associated urinary tract infection (CAUTI)** can occur when bacteria or other germs travel along a urinary catheter, resulting in an infection in the bladder or the kidney.

# Guide to Understanding Healthcare Worker Influenza Vaccination

Influenza, or “the flu,” is a mild to severe respiratory illness caused by the influenza virus. It is a contagious illness, meaning that it can easily spread from person to person. If healthcare workers (also known as healthcare personnel) become infected with the flu, they can spread this illness to their coworkers and patients. Some patients in a hospital are at high risk for complications from the flu, such as the elderly, very young, or those with severe chronic illnesses. Extra care should be taken to prevent the spread of the flu among healthcare workers and patients.

The best way to prevent the flu is by getting vaccinated. The Centers for Disease Control and Prevention (CDC) recommends that all healthcare personnel who work in a healthcare setting receive the flu vaccine each year to help prevent the spread of flu within the workplace. Healthcare personnel include all facility employees, licensed independent practitioners, adult students/trainees, and volunteers regardless of full time/part time status, clinical responsibility or patient contact. ***Studies show that patients benefit when healthcare workers get vaccinated.***

Many hospitals choose to provide the flu vaccine to their employees, and some hospitals even have policies requiring mandatory vaccination. Currently, there are no state regulations requiring vaccination in Tennessee, and healthcare workers are able to decline the flu vaccine for any reason.

This report shows the percentage of all healthcare workers in each hospital who received the flu vaccine. Higher percentages are better, because this indicates that a greater number of healthcare workers are protected against the flu. The Department of Health and Human Services (HHS) Healthy People 2020 goal for healthcare worker flu vaccination in the United States is 90%.

*For more information about the CDC recommendations and the national trends of influenza vaccination coverage, see here: <http://www.cdc.gov/flu/healthcareworkers.htm>*

# Things to Think About When Choosing a Healthcare Facility

- Does your doctor recommend the facility? Why or why not?
- Does your health insurance cover treatment at this facility? If not, ask your doctor if there are benefits of out-of-network care.
- Is your hospital accredited by a nonprofit organization that seeks to improve the quality and safety of healthcare (e.g., The Joint Commission or DNV-GL)?
- Do you know your doctor's or healthcare provider's qualifications? Is he or she licensed and board-certified? Consult your state licensing board for information on licensure and disciplinary actions that may have been taken.
- What infection prevention resources are at your healthcare facility? If you have questions, find out how you can get in touch with someone in infection prevention before you visit the facility.
- Does your healthcare facility have a patient advocate? If so, s/he may be able to provide additional consultation and services before, during, and after your medical treatment.
- If you are planning to have surgery:
  - Does the facility do a lot of the procedures that you will be having? Patients who have surgery at hospitals that do more surgical procedures may have better outcomes<sup>3</sup>.
  - Does the facility have a floor or unit that only does the type of surgery you are having? For example, for hip replacement surgery, does the facility have a floor or unit that is used only for joint replacement surgeries?
  - Does the facility have one or more operating rooms that are used only for your type of surgery?
  - Does the facility follow specific guidelines so that everyone who has your type of surgery receives consistent care?
- The federal government reports other quality information about hospitals, in addition to healthcare associated-infections. Find this information online at:  
[www.hospitalcompare.hhs.gov](http://www.hospitalcompare.hhs.gov)
- The Centers for Medicare and Medicaid Services has a comprehensive guide available to assist patients in selecting a hospital. Find this at:  
<http://www.medicare.gov/Pubs/pdf/10181.pdf>

# What Patients Can do to Prevent Infections

## ***To prevent all infections:***

- If you do not see your healthcare providers clean their hands before caring for you, don't be shy about asking them to do so. This is your healthcare, and you have a right to speak up!
  - Make sure you and your family members and friends keep their hands clean too!
- Ask your healthcare provider what specific steps s/he takes to prevent infections as well as what you can do to prevent infections before, during, and after your visit as it applies to your care.

## ***To prevent central line-associated bloodstream infections (CLABSIs) and catheter-associated urinary tract infections (CAUTIs):***

If you have a central line or urinary catheter put in place, ask your doctors and nurses to explain why you need it and how long you will have it.

- Ask your healthcare providers each day if you still need it.
- If the bandage covering your central line becomes wet or dirty, tell your nurse or doctor immediately.
- Tell your nurse or doctor if the area around your central line or catheter is sore or red, or you feel feverish.
- Follow your healthcare providers' instructions for the care of the central line or urinary catheter to keep it working as it should and keep it clean and free of germs.
- Do not let family and friends touch the central line tubing or bandage.
- See [FAQs about CLABSI](#) and [FAQs about CAUTI](#) for more information.

## ***To prevent surgical site infections (SSIs):***

### ***Immediately after your surgery and during recovery:***

- Avoid touching your incision area and follow all instructions from your doctor about how to take care of your incision.
- Before and after taking care of your incision area, wash your hands or use an alcohol-based hand sanitizer and have any family member helping with your care do the same.
- If you have any infection signs/symptoms like redness, pain, fever, or drainage, call your doctor ASAP.
- Until the incision is completely healed, always use a different washcloth for the incision area than the one used for the rest of your body.
- Keep clean sheets on your bed and make sure the clothes that come in contact with your incision are clean.
- Keep pets away from the incision until healed.

***Before you leave the hospital or ambulatory surgery center:***

- Make sure you understand how to take care of your wound and ask questions when you are unsure.
- Know who to contact if you have questions or problems after you get home.
- Keep all appointments scheduled at the time of discharge.

See [FAQs about SSIs](#) for more information.

***To prevent Clostridium difficile infections:***

- Take antibiotics only as prescribed by your doctor and complete the course of treatment.
- Tell your doctor if you have recently been on antibiotics or if you get diarrhea within a few months of taking the antibiotics.
- Wash your hands before eating and after using the bathroom.
- See [FAQs about Clostridium difficile](#) for more information.

***To prevent methicillin-resistant Staphylococcus aureus (MRSA) infections:***

- Clean your hands often, especially before and after changing wound dressings or bandages.
- Keep wounds clean and change bandages as instructed until healed.
- Avoid sharing personal items such as towels or razors.
- Take antibiotics only as prescribed by your doctor and complete the course of treatment.
- See [FAQs about MRSA infections](#) for more information.

***To prevent influenza or the “flu”:***

Get vaccinated against the flu each year, clean your hands often, and cover your cough with your sleeve.

**BE INFORMED. BE EMPOWERED. BE PREPARED.**

# 6 WAYS TO BE A SAFE PATIENT

**1**

## **SPEAK UP.**

Talk to your doctor about all questions or worries you have. Ask them what they are doing to protect you.

- ▶ If you have a catheter, ask each day if it is necessary.
- ▶ Ask your doctor how he/she prevents surgical site infections. Also ask how you can prepare for surgery to reduce your infection risk.

**2**

## **KEEP HANDS CLEAN.**

Be sure everyone cleans their hands before touching you.

**3**

## **GET SMART ABOUT ANTIBIOTICS.**

Ask if tests will be done to make sure the right antibiotic is prescribed.

**4**

## **KNOW THE SIGNS AND SYMPTOMS OF INFECTION.**

Some skin infections, such as MRSA, appear as redness, pain, or drainage at an IV catheter site or surgery site. Often these symptoms come with a fever. Tell your doctor if you have these symptoms.

**5**

## **WATCH OUT FOR DEADLY DIARRHEA. (AKA *C. difficile*)**

Tell your doctor if you have 3 or more diarrhea episodes in 24 hours, especially if you have been taking an antibiotic.

**6**

## **PROTECT YOURSELF.**

Get vaccinated against flu and other infections to avoid complications.

245525-E

# Appendices

## **Appendix A. Acronyms**

CAUTI – catheter-associated urinary tract infection  
CCU – critical care unit (used interchangeably with intensive care unit (ICU))  
CDC – Centers for Disease Control and Prevention  
CDI – *C. difficile* infection  
CLABSI – central line-associated bloodstream infection  
CMS – Centers for Medicare and Medicaid Services  
CO – community onset  
COLO – colon surgery  
HAI – healthcare-associated infection  
HO – healthcare facility onset  
HYST – abdominal hysterectomy  
IP – infection preventionist  
ICU – intensive care unit (use interchangeably with critical care unit (CCU))  
MRSA – methicillin-resistant *Staphylococcus aureus*  
NHSN – National Healthcare Safety Network  
NICU – neonatal intensive care unit  
OR – operating room  
PROC – surgical procedures  
SSI – surgical site infection  
TDH – Tennessee Department of Health  
TN – Tennessee
