- Appendix D CEC Standard Operating Procedures

## EXECUTIVE SUMMARY

This report documents the third quarter 2019 assessment-monitoring event, which was performed at the former Environmental Waste Solutions, LLC (EWS) Camden Class II Landfill on September 5-6, 2019, and on September 12, 2019.

The former EWS Camden Class II Landfill is located in Benton County at 200 Omar Circle, Camden, Tennessee (latitude 36°03'16" N/longitude -88°05'16" W), and was formerly registered with the Tennessee Division of Solid Waste Management (DSWM) with permit number IDL 03-0212 and previously received secondary aluminum smelter waste for disposal including aluminum dross, salt cakes, and other industrial wastes. The IDL 03-0212 permit was terminated in July 2017.

Beginning in 2008, the site entered into the Groundwater Detection-Monitoring Program, and groundwater samples were collected from site monitoring wells on a semi-annual basis. EWS entered the Assessment Monitoring Program because of chloride concentrations reported above the 250 mg/l EPA secondary drinking water standard (2DWS) at monitoring well MW-3 during the November 2015 semi-annual detection-monitoring event. As a result, additional groundwater quality assessment activities were completed which included the installation of a new permanent groundwater monitoring well (MW-5), the installation of three (3) temporary monitoring wells (TMW-1, TMW-2, TMW-3), and completion of a private water-use survey. In addition, the semi-annual detection monitoring frequency was increased from semi-annual to quarterly assessment monitoring. The observed chloride concentration at MW-3 during this September 2019 event (17.9 mg/l) was well below the 2DWS.

Quarterly assessment monitoring activities have been performed since the November 2015 monitoring event in general accordance with the site's Groundwater Quality Assessment Plan (GWQAP) dated March 14, 2016. During the second quarter 2017 assessment-monitoring event, total cadmium was detected above the maximum contaminant level (MCL) at MW-3, which was the first MCL exceedance for total cadmium concentrations at any well location on site. As a result, enhancements have been made to the sampling and analytical program for the site.

The 3<sup>rd</sup> Quarter 2019 sampling event at the facility included the following sampling activities:

Groundwater samples were collected by CEC on September 5, 2019 and September 6, 2019 from MW-1, MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3. Leachate samples were also collected by CEC on September 6, 2019 from the "Industrial Waste Cell (IWC)" and on September 12, 2019 from the "Aluminum Processing Waste Cell (APWC)" locations.

Pace Analytical (Pace), formerly ESC Lab Sciences, was the laboratory sub-contracted to perform the chemical analyses. Laboratory reports for the 3<sup>rd</sup> quarter 2019 groundwater analyses were prepared by Pace and reported to CEC on September 16, 2019. Laboratory reports from the 3<sup>rd</sup>

quarter 2019 leachate analyses were prepared by Pace and reported to CEC on September 17, 2019 and September 23, 2019.

The reported concentrations of chemicals detected in the groundwater monitoring wells and temporary monitoring wells were reviewed and compared against their respective U.S. EPA Maximum Contaminant Levels (MCLs) and U.S. National Secondary Drinking Water Standards (2DWS). Where primary or secondary standards weren't available (i.e. cobalt), concentrations were reviewed and compared against their EPA Regional Screening Levels (RSLs). Statistical analysis methods were used to identify whether there were any statistically significant increases (SSIs) in any site monitoring wells over background concentrations for the analyzed water quality parameters. The results of the analyses during this assessment monitoring event are summarized in the following paragraphs.

Total cadmium was detected above the MCL (0.005 mg/l) at MW-3 during the September 6, 2019 monitoring event (total cadmium at MW-3 = 0.0088 mg/l). Total cadmium was also detected above the MCL in the duplicate sample collected at MW-3 during the September 6, 2019 monitoring event (total cadmium at MW-3 duplicate sample = 0.00822 mg/l). The cadmium detections at MW-3 during this event were the only cadmium detections above the Practical Quantification Limit (PQL) at any of the groundwater monitoring locations. The statistical trend analysis for total cadmium at MW-3 does confirm an increasing trend having statistical significance when considering all current and past data for cadmium at MW-3. However, based on the Mann-Kendall trend test, no distinct statistically significant trend was identified for total cadmium concentrations at MW-3 when considering data from the past 10 sampling events since June 2017. The total cadmium concentrations at MW-3 (0.0088 mg/l) and the duplicate sample collected at MW-3 (0.00822 mg/l) during this September 5, 2019 were lower in concentration than the previous 2<sup>nd</sup> Quarter 2019 monitoring event (0.0292 mg/l), the 1<sup>st</sup> quarter 2019 event (0.0117 mg/l), the 4th quarter 2018 event (0.144 mg/l), the 3rd quarter 2018 event (0.297 mg/l), and the 3rd quarter 2018 re-sample event on September 27, 2018 (total cadmium at MW-3=0.204 mg/l). Total cadmium was first detected above the MCL at MW-3 during the June 8, 2017 event (total cadmium at MW-3 = 0.0286 mg/l).

Although there have been elevated concentrations of total cadmium in MW-3, the extent of cadmium in the groundwater at the site appears to be limited to the area around MW-3, as there have been no detections of cadmium above the laboratory PQL (0.001 mg/l), as of this date, from groundwater samples extracted from temporary monitoring wells TMW-2 and TMW-3 that are immediately down-gradient of MW-3.

Ten SSIs were identified over background during this event. In addition to the total cadmium in MW-3, SSIs included chloride (MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3), fluoride

(MW-3), zinc (MW-3), and sulfate (MW-3). The chloride, fluoride, zinc, and sulfate detections observed in the site monitoring wells were all below their associated MCLs or 2DWS.

\* ppm – parts per million\* is equivalent to mg/l – milligrams per Liter for water samples

## **1.0 INTRODUCTION**

### **1.1 SITE LOCATION**

The former Camden Class II landfill is located just off Highway US 70 at 200 Omar Circle, Camden, Tennessee. The site is located on the Camden, Tennessee USGS quadrangle at north latitude 36° 03' 16" and west longitude -88° 05' 16" at an average elevation of 400 feet above mean sea level datum (MSL). The location of the facility is shown in Appendix A – Figure 1 – Site Location Map. The landfill footprint can be viewed in Appendix A – Figure 2 – Potentiometric Surface Map.

### **1.2 CURRENT ACTIVITIES**

The former EWS Camden Class II landfill is not currently operating (i.e., the permit has been terminated, and TDEC is in the process of achieving certified final closure of the site) and substantial landfill cap construction activities have been completed. Continued post-closure activities being implemented at the facility are intended to protect the environment and human health and include leachate pre-treatment, leachate hauling and disposal, storm water management activities, and groundwater monitoring activities.

## 2.0 AQUIFER CHARACTERISTICS

### 2.1 GEOLOGIC AND AQUIFER CHARACTERISTICS

The extensive reworking of the site because of the excavation of chert for local road and fill projects has impacted the original site geology. Based upon a review of the Tennessee Division of Geology (TDOG) Geologic Map and site observations, it appears that the site is within the Camden and Harriman Formations. It is reported by the TDOG that the Camden and Harriman Formations are lithologically identical and not enough fossils are present to form a convenient basis for subdivision.

#### 2.1.1 Camden and Harriman Formations

The Camden and Harriman Formations are described as follows: chert, gray with specks and mottling's of very light-gray and yellowish-gray (surfaces stained pale to dark yellowish-orange), bedded and blocky (beds 2 to 8 inches thick), dense, conchoidal fracture, contains pods of white to light gray tripolitic clay, locally stained yellow and brown, and fossiliferous. Locally, especially near the top, fragments of chert are cemented into large masses and beds of breccia by dark-brown to moderate-red limonite.

Groundwater potentiometric data collected from the uppermost water-bearing zone across the entire landfill site footprint during the 1999 and 2006 hydrogeological investigations indicated that groundwater flow in the uppermost aquifer is generally to the south. Comparisons of the water bearing zone elevations to static groundwater elevations indicate an unconfined aquifer.

### 2.2 MONITOR WELL INTEGRITY & STATIC WATER LEVELS

The groundwater-monitoring network for the former EWS Class II Landfill currently consists of monitoring wells MW-1, MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3. Due to insufficient groundwater volumes for sampling, MW-2 has been removed from the regular sampling network and replaced by MW-4. MW-2 is still intact and is used for potentiometric surface measurements and field parameter testing. Monitoring well MW-1 serves as an up-gradient monitoring point, while monitoring wells MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3 serve as down-gradient monitoring points. The temporary wells (TMW-1, TMW-2, and TMW-3) were installed with the purpose of delineating the areal extent of groundwater contamination and providing additional potentiometric interpretation. The installation of these temporary wells were in response to elevated chloride concentrations at MW-3, which were first detected during the November 2015 sampling event. In addition to providing potentiometric information for the site, these temporary wells yield groundwater samples for water-quality analyses.

The following table presents the wells that were used to develop this report.

| <b>Up-gradient Monitoring Points</b> | <b>Down-gradient Monitoring Points</b>    |
|--------------------------------------|---|
| MW-1                                 | MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3 |

Before purging and sampling activities began, depth to water (DTW) measurements were collected at each of the above-referenced monitoring wells using an electronic water level indicator such as the Solinst® model #122 electronic water-level indicator. DTW measurements were also collected from MW-2 for potentiometric interpretation. DTW measurements were collected in the following order from first to last: MW-1, MW-5, TMW-1, TMW-2, TMW-3, MW-4, MW-2, and finally MW-3.

The integrity of each monitoring well was checked during each sampling event prior to groundwater collection. The physical condition of each wellhead was observed and noted along with the condition of all locking mechanisms for each monitoring well. Once the watertight seal was removed from the top of each monitoring well's casing, the well was allowed to equilibrate to atmospheric conditions. The water-level indicator was decontaminated in accordance with the United States Environmental Protection Agency-Science and Ecosystem Support Division (USEPA SESD) procedures for field water-level measurements in between wells and a new pair of clean nitrile gloves were donned at each monitoring location while collecting DTW measurements. The decontaminated electronic water-level indicator was slowly lowered into the well to establish the distance between the top of casing and the elevation of free groundwater. The electronic probe was capable of determining this distance to within one-hundredth of one foot (0.01 foot). The distance was written in the site-specific field book or field data sheet as DTW. Upon collection of these data, the electronic water-level indicator was removed from the monitoring well and decontaminated.

The following equation is used to determine the elevation of groundwater at each well:

$$\textit{Established Top of Casing Elevation} - \textit{Depth to Water} = \textit{Groundwater Elevation}$$

Top of casing elevation has been determined by a licensed land surveyor and is referenced to the current Tennessee State Plane Coordinate System. The top of casing elevations for all site-monitoring wells (MW-1, MW-2, MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3) were updated by a licensed land surveyor on May 12, 2016. Groundwater elevations are listed in Appendix A – Table 1 – Field Parameters & Potentiometric Data and reflect the most recent survey.

## **2.3 GROUNDWATER FLOW DIRECTION**

Groundwater at the landfill appears to generally flow in a southern direction towards Charlie Creek and Cane Creek. Groundwater flow in the vicinity of the former EWS Class II Landfill generally flows from a topographic high north of the landfill towards monitoring wells MW-2, MW-3, MW-4, and MW-5 and temporary monitoring wells TMW-1, TMW-2, and TMW-3, which are all down-gradient of the waste cells.

## 2.4 POTENTIOMETRIC GRADIENT

The potentiometric surface of the unconfined aquifer occurring beneath the former EWS Class II Landfill occurs at approximately twenty-two (22) feet below the top of casing at the up-gradient monitor well MW-1 to approximately eleven (11) feet below the top of casing at monitor well MW-4. The potentiometric gradient calculated from groundwater elevation data collected on September 5, 2019 is approximately 1.23%.

The potentiometric gradient is calculated according to the following formula:

$$\frac{\text{Highest GW. Elev. (MW-1)} - \text{Lowest GW. Elev. (MW-4)}}{\text{Horizontal Distance between the Wells}} * 100 = \text{Pot. Grad.}$$

$$\frac{(393.43') - (369.92')}{1,910'} * 100 = 1.23\%$$

The above calculation assumes a perpendicular gradient between the potentiometric elevations from MW-1 and MW-4. These assumptions may provide an artificially higher potentiometric gradient than is likely occurring at the site.

## 2.5 HYDRAULIC CONDUCTIVITY

Hydraulic conductivity estimations within the uppermost aquifer occurring beneath the landfill have not been determined at this time.

## **3.0 GROUNDWATER SAMPLING PROCEDURES**

### **3.1 INSTRUMENTATION**

Before purging and sampling activities began, DTW measurements were collected at each of the monitoring wells. A YSI Professional Plus<sup>®</sup> multi-parameter instrument (YSI) was used to record pH, conductivity, temperature, dissolved oxygen (DO), and oxidation-reduction potential (ORP) during groundwater sampling events at the landfill. A Hach<sup>®</sup> model 2100Q turbidity meter was used to collect turbidity readings. Each instrument was either checked against known standards or calibrated per manufacturers' specifications prior to the commencement of sampling activities.

### **3.2 GROUNDWATER PURGING AND COLLECTION OF FIELD PARAMETER VALUES**

On November 29, 2017, dedicated submersible bladder pumps (low-flow bladder pumps) were installed in each of the groundwater monitoring wells (MW-1, MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3). During the December 11, 2017 sampling event, monitoring personnel for the former EWS Class II Landfill began utilizing low-flow protocols as described within the USEPA's Issue Paper EPA/540/S-95/504: Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures, April 1996. The low-flow protocols have continued to be utilized by monitoring personnel during each quarterly groundwater assessment-monitoring event since December 11, 2017. Additionally, groundwater-sampling activities were completed during this sampling event in accordance with the USEPA SESD sampling procedure -SESDPROC-301-R4 titled "Groundwater Sampling", effective April 26, 2017.

Each dedicated submersible bladder pump is of stainless steel construction, and each is equipped with a Teflon<sup>™</sup> bladder and dedicated Teflon<sup>™</sup>-lined bonded twin polyethylene tubing (airline and water discharge line). The low-flow bladder pumps were operated by using a special control box, which controls the pressure and frequency of the pumping action and was used to adjust the flow rate of the water. The flow rate used was adjusted to minimize stress (drawdown), prevent damage to monitoring well components, and to minimize the risk of introducing sediments into the monitoring well through the well's gravel pack. Water pumped was withdrawn directly from the formation with little mixing of casing water or disturbance to the sampling zone. The initial amount of purged groundwater was collected in a clean, high-density polyethylene (HDPE) flow-through cell while measuring temperature, pH, conductivity, DO, and ORP. A turbidity meter was used to collect turbidity readings during low-flow purging activities.

The start time of purging, the parameter measurements at intervals during purging, estimated pumped volumes, depths to water for low-flow sampling, and any notes of unusual conditions were recorded during purging activities. Field parameter measurements (temperature, pH, conductivity, DO, ORP, and turbidity) were collected periodically until proper field stabilization goals had been met, which are defined by the USEPA SESD as: "for at least three consecutive measurements, the pH remains constant within 0.1 Standard Unit (SU), conductivity varies no more than 5 percent, and the turbidity has either stabilized or is below 10 Nephelometric Turbidity

Units (NTUs)". Other parameters such as DO were also measured as a purge-adequacy parameter. Normal goals for DO are 0.2 mg/l or 10% saturation, whichever is greater. Temperature and ORP were measured during purging to obtain measurements of record for these parameters for each sampling event.

During the September 5, 2019 monitoring event, a peristaltic pump was utilized during purging activities in the temporary monitoring wells (TMW-1, TMW-2, and TMW-3). According to the USEPA SESD groundwater sampling procedures, peristaltic pumps can be utilized as an alternative and acceptable method for low-flow or multiple volume purging and sampling activities.

Peristaltic pumps require three separate pieces of tubing in order to function: (1) a section of Teflon<sup>®</sup> tubing, which is lowered into the well, (2) a small section of flexible Masterflex<sup>®</sup> silicone tubing, which is installed into the peristaltic pump head, and (3) a small section of Teflon<sup>®</sup> tubing, which connects the pump head to the flow-through cell. The first section of tubing was deployed to the approximate mid-screen within the well (approximately 4 feet above the bottom of the well casing) and cut above the ground surface. The free end of the first section of tubing was connected to the flexible Masterflex<sup>®</sup> silicone tubing situated in the peristaltic pump head. Finally, the third section of tubing (second section of Teflon<sup>®</sup> tubing) connected the Masterflex<sup>®</sup> silicone tubing at the pump head to the flow-through cell for collection of field chemistry parameter measurements. In order to prevent the transfer of residuals between sampling locations, all three sections of tubing were replaced between each well. After replacement of all sections of tubing, the peristaltic pump was turned on, and a suitable (slow) pumping rate was achieved to maintain a minimal and stable drawdown level. Field parameters were collected from the initial amount of water that was purged and measurements were collected periodically until the parameters had stabilized as described above.

With respect to groundwater chemistry, an adequate purge is achieved when the pH and conductivity have stabilized and the turbidity either has stabilized or is below 10 NTUs. If the field parameters were not stable, the purging procedures continued until one of the following adequate purge conditions were met:

1. Field stabilization occurred.
2. Well was purged dry. For wells with slow recovery, attempts were made to avoid purging to dryness by slowing the purge rate. In some situations, even with slow purge rates, the well may be pumped dry. This situation generally indicates that an adequate purge had been achieved and the well was sampled following sufficient recovery (enough volume to allow filling of all sample containers).
3. A minimum of three well volumes were purged.

Field chemistry parameters were collected periodically at the temporary wells until field parameter measurements had stabilized, and at least three well volumes were removed from each temporary monitoring well. The purge water from down-gradient monitoring wells MW-3, MW-4, MW-5,

TMW-1, TMW-2, and TMW-3 were containerized and discarded into the on-site leachate collection system storage tank.

Field parameter values for each well are presented in Table 1 – Field Parameters and Potentiometric Data in Appendix A. A detailed account of each purge and sample procedure conducted at each monitoring well is presented in Appendix D – CEC Standard Operating Procedures.

### **3.3 GROUNDWATER SAMPLE COLLECTION & PRESERVATION**

Groundwater samples were collected from monitoring wells when field parameter data indicated that stagnant water had been purged from the well and replaced by groundwater from the adjacent formation that is representative of actual aquifer conditions. Groundwater was placed in the laboratory supplied sample vessels in the following order: Appendix I organics – three (3) forty (40) mL amber glass containers preserved with hydrochloric acid (HCl); Appendix I organics EDB and DBCP– three (3) forty (40) mL clear glass containers preserved with sodium thiosulfate ( $\text{Na}_2\text{S}_2\text{O}_3$ ); total metals (Appendix I metals, Al, Ca, Fe, K, Mg, Mn, Na, and Boron) – one (1) two-hundred fifty (250) ml HDPE container preserved with nitric acid ( $\text{HNO}_3$ ); alkalinity – one (1) one-hundred (100) ml unpreserved amber glass container; bromide, chloride, nitrate, and sulfate – one (1) two-hundred fifty (250) ml unpreserved HDPE container; COD & ammonia – one (1) two-hundred fifty (250) ml HDPE jar preserved with sulfuric acid ( $\text{H}_2\text{SO}_4$ ). In addition to total metals analysis, dissolved metals samples were collected for analysis (dissolved Appendix I metals, Al, Ca, Fe, K, Mg, Na, and Boron) at MW-5, TMW-1, TMW-2, and TMW-3. Each dissolved metals sample was collected by field filtering the groundwater using a new disposable 0.45-micron filter and placing the filtered groundwater into one (1) two-hundred fifty (250) ml HDPE container preserved with  $\text{HNO}_3$ . As soon as samples were collected in their respective containers, samples were preserved accordingly and placed on ice in a sample cooler.

As described in the previous section, a peristaltic pump was used to purge temporary monitoring wells TMW-1, TMW-2, and TMW-3. Samples for organic analysis cannot be exposed to the flexible peristaltic pump-head tubing, due to the risk of contaminant sorption and/or the risk of the dissolution of organic compounds to the sample. Therefore, the sample containers for the more turbidity-sensitive analysis were filled first (metals), and samples for organic analysis were collected using a clean Teflon<sup>®</sup> bailer at each temporary monitoring well.

### **3.4 LEACHATE SAMPLING PROCEDURES**

Leachate samples were collected by CEC on September 6, 2019 from the “Industrial Waste Cell (IWC)” and September 12, 2019, from the “Aluminum Processing Waste Cell (APWC)”. The IWC leachate sample was collected from the leachate collection system associated with the industrial waste cell and was collected directly from the associated leachate collection hose within the lift station. The APWC leachate sample was collected from the leachate collection system associated with the aluminum processing waste cell and was collected directly from the associated leachate collection hose before the leachate entered the APWC leachate collection tanks.

Laboratory reports from the leachate analyses were prepared by Pace and reported to CEC on September 17, 2019 and September 23, 2019. The approximate APWC and IWC leachate sample locations are shown on Figure 2 – Potentiometric Surface Map located in Appendix A.

### **3.5 QUALITY ASSURANCE AND QUALITY CONTROL**

#### **3.5.1 Field Quality Assurance and Quality Control**

Field Quality Assurance and Quality Control (QA/QC) samples were collected as part of the groundwater-sampling program. Quality assurance (with internal laboratory quality controls) addresses the accuracy and repeatability of analytical results after analysis in the laboratory. Quality control addresses methods to preserve the integrity of samples in the field and during shipping to the laboratory. Quality control may be accomplished by incorporating trip blanks, field blanks, field duplicates, and equipment (rinsate) blanks into the analytical program.

A field blank and a duplicate sample were collected during this groundwater-monitoring event. CEC collected a field blank next to monitoring well MW-3 and a duplicate sample was collected from MW-3. The field blank was collected by pouring deionized water into a set of sample bottles provided by the laboratory, thereby allowing any airborne contaminants a chance to enter the field blank sample. The duplicate sample was collected by taking separate samples from within MW-3 at the same time. In addition, a laboratory supplied trip blank for VOC analysis was prepared and placed in a cooler, which was present during groundwater sampling activities. Upon the collection of the final groundwater sample, the trip blank was placed in a sample cooler and delivered to Pace for VOC analysis. No VOCs were detected above the laboratory PQL in the trip blank sample.

Pace reported the groundwater laboratory analytical results to CEC on September 16, 2019. Laboratory analytical testing of the field blank presented in the analytical report revealed that COD was detected above the laboratory PQL (10 mg/l). Along with COD, analytical testing of the field blank also revealed the presence of the VOCs acetone and 2-Butanone (MEK) above their respective laboratory PQLs. Acetone and MEK are typical lab contaminants. Most of the results for the duplicate sample collected from MW-3 were similar to the original MW-3 sample results.

#### **3.5.2 Laboratory Quality Assurance and Quality Control**

In order to demonstrate that a laboratory is producing data of adequate precision, accuracy and sensitivity, it is necessary to assess all laboratory procedures at all stages from sampling to reporting. The laboratory completed specific control and assessment procedures designed to monitor, quantitatively, the accuracy and precision of specific assays. Laboratory Internal Quality Assurance (IQA) refers to the full range of practices employed to ensure that laboratory results are reliable. Internal Laboratory Quality Control (IQC) consists of the operational techniques used by the laboratory staff for continuous assessment of the quality of the results of individual analytical procedures. The specific quality-control procedures utilized by the analytical laboratory are summarized in the following table:

| Quality Criteria Category          | Quality Control Laboratory Methods   |
|------------------------------------|--|
| Precision                          | Laboratory duplicates at a frequency of one per matrix spike, one per laboratory control sample, and one per method blank. |
| Bias                               | Matrix spikes, laboratory control samples, method blanks at a frequency of one sample per standard batch.                  |
| Representative and Comparable Data | Adherence to standard analytical procedures, analytical methods, units of measurement, and detection limits.               |

The groundwater analytical report from the September 2019 event indicated that the same analyte was found in the associated laboratory blank for the detected concentrations of total Hardness (APWC-Leachate), as laboratory qualifier “B”. Since the same constituent concentrations were found in the method blank, the reported concentrations (indicated as laboratory qualifier “B”) may be falsely higher than the actual concentrations. The internal laboratory IQA and IQC results are included in the laboratory analytical reports located in Appendix C – Laboratory Analytical Reports & Field Information Logs.

### 3.6 SAMPLE CHAIN-OF-CUSTODY

A sample Chain-of-Custody (COC) traveled with the sample kit from Pace to the former EWS Class II Landfill site and back to Pace for the September 2019 sampling event. The CEC SOP 07-01-01 for maintaining sample Chain of Custody is presented in Appendix D – CEC Standard Operating Procedures.

## 4.0 LABORATORY ANALYTICAL PROCEDURES

### 4.1 ANALYTICAL METHODS

All laboratory analyses for the third quarter 2019 groundwater assessment-monitoring event were completed by Pace Analytical. The analytical methods chosen for these monitoring events were in full compliance with the procedures required by the DSWM and the USEPA's publication SW-846, entitled Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (3rd Edition).

The SW-846 methods used for the analysis of **groundwater and leachate samples** were as follows:

|                    |   |
|--------------------|---|
| Method 6010b       | Inductively Coupled Plasma (ICP) – Atomic Emission Spectrometry (Boron only)                                |
| Method 6020        | ICP – Mass Spectrometry (metals & dissolved metals)   |
| Method 2320 B-2011 | Alkalinity  |
| Method 7470A       | Mercury in Liquid Waste – Manual Cold Vapor Technique   |
| Method 8011        | 1,2-dibromoethane & 1,2 dibromo-3-chloropropane by Micro-extraction and Gas Chromatography                  |
| Method 8260B       | Volatile Organic Compounds by Gas Chromatograph/Mass Spectrometry   |
| Method 9056A       | Determination of Inorganic Anions by Ion Chromatography (Bromide, Chloride, Fluoride, Nitrate, and Sulfate) |
| Method 130.1       | Hardness (colorimetric) as CaCO <sub>3</sub>  |
| Method 350.1       | Ammonia Nitrogen  |
| Method 410.4       | Chemical Oxygen Demand (COD)  |

### 4.2 LABORATORY ANALYTICAL RESULTS

Third quarter groundwater samples were collected by CEC on September 5, 2019 and September 6, 2019. Pace performed the groundwater analysis and reported the results on September 16, 2019. Third quarter leachate samples were collected by CEC on September 6, 2019 from the “Industrial Waste Cell (IWC)” and September 12, 2019 from the “Aluminum Processing Waste Cell (APWC)” leachate sampling locations. Pace performed the leachate analysis and reported the results on September 17, 2019 and September 23, 2019.

Constituent values from all inorganic laboratory analyses for groundwater and leachate samples, along with applicable MCLs or 2DWSs, are presented in Table 2a – Groundwater and Leachate Analytical Data in Appendix A. Copies of the laboratory reports are located in Appendix C – Laboratory Analytical Report & Field Information Logs.

#### 4.2.1 EWS Groundwater Quality Relative to the EPA Primary Drinking Water Standards

**Total Arsenic** was detected above the MCL (0.01 mg/l) at MW-1 (0.0176 mg/l) during this 3<sup>rd</sup> Quarter 2019 event. The lower limit for the 95% confidence interval about the mean for arsenic at MW-1 (incorporating the arsenic concentrations for the last 10 events, using distribution fitting with the lognormal distribution as the best fit) is 0.0168 mg/L. This is above the MCL for arsenic. In addition, total arsenic was detected above the PQL (0.002 mg/l) in TMW-3 (0.00387 mg/l). During the previous 2<sup>nd</sup> Quarter 2019 event, arsenic was also detected above the MCL in MW-1 (0.0194 mg/l), but was not detected above the PQL in TMW-3. Arsenic was not detected above the MCL in any of the monitoring locations during the 1<sup>st</sup> Quarter 2019 event.

**Total Cadmium** was detected above the MCL (0.005 mg/l) at MW-3 during the September 6, 2019 monitoring event (total cadmium at MW-3 = 0.0088 mg/l). In addition, total cadmium was detected above the MCL in the duplicate sample collected from MW-3 during the September 6, 2019 monitoring event (total cadmium at duplicate MW-3 = 0.00822 mg/l). A summary of cadmium concentrations (total cadmium and dissolved cadmium) and turbidity values observed at MW-3 during each sampling event since May 9, 2016 is referenced in the table below:

| <b>MW-3<br/>Summary of Cadmium Concentrations<br/>and Turbidity Measurements</b> |                                     |                                      |                            |
|--|-------------------------------------|--------------------------------------|----------------------------|
| <b>Date</b>  | <b>Total<br/>Cadmium<br/>(mg/l)</b> | <b>Cadmium,<br/>Dissolved (mg/l)</b> | <b>Turbidity<br/>(NTU)</b> |
| 9/6/2019   | <b>0.0088</b>                       | NA                                   | <b>2.98</b>                |
| 6/4/2019   | <b>0.0292</b>                       | <b>0.0297</b>                        | <b>2.98</b>                |
| 3/5/2019   | <b>0.0117</b>                       | <b>0.0133</b>                        | <b>6.27</b>                |
| 12/4/2018  | <b>0.144</b>                        | <b>0.139</b>                         | <b>4.77</b>                |
| 9/27/2018  | <b>0.204</b>                        | <b>0.204</b>                         | <b>1.05</b>                |
| 9/12/2018  | <b>0.297</b>                        | <b>0.320</b>                         | <b>1.12</b>                |
| 6/19/2018  | <b>0.0312</b>                       | <b>0.0292</b>                        | <b>4.90</b>                |
| 3/22/2018  | <b>0.00671</b>                      | <b>0.00637</b>                       | <b>24.3</b>                |
| 12/14/2017   | <b>0.00659</b>                      | <b>0.00733</b>                       | <b>23.0</b>                |
| 9/28/2017  | <b>0.00926</b>                      | <b>0.0102</b>                        | <b>18.9</b>                |
| 8/8/2017   | <b>0.0113</b>                       | NA                                   | <b>16.6</b>                |
| 6/8/2017   | <b>0.0286</b>                       | NA                                   | <b>34.8</b>                |
| 11/10/2016   | <b>0.00177</b>                      | NA                                   | <b>64.5</b>                |
| 5/9/2016   | <0.001                              | NA                                   | <b>8.39</b>                |

As demonstrated in the summary table above, the total cadmium concentrations at MW-3 and the duplicate sample collected at MW-3 during this September 6, 2019 were lower in concentration than the previous June 4, 2019 monitoring event. The cadmium concentrations at MW-3 decreased during every sampling event from September 12, 2018 to March 5, 2019. During the September 6, 2019 sample event, observed cadmium concentrations were at the lowest recorded level since

March 22, 2018. In addition, the turbidity result for MW-3 on September 6, 2019 (2.98 NTUs) was within the recommended goal of 10 NTUs and is consistent with recent monitoring events.

Total cadmium was first detected at a level above the laboratory PQL, but at a level below the MCL (<0.005 mg/l), in MW-3 during the 4th quarter 2016 sampling event completed on November 10, 2016. Total cadmium was first detected above the MCL of 0.005 mg/l at MW-3 during the June 8, 2017 event. Although there have been elevated detections of total cadmium in MW-3, there have been no detections, as of this date, from groundwater samples extracted from any other monitoring wells at the site including monitoring wells TMW-1, TMW-2, and TMW-3, which are down-gradient from MW-3.

**Total Cobalt** was detected in up-gradient well MW-1 (0.0763 mg/l) and down-gradient wells MW-5 (0.00288 mg/l) and TMW-3 (0.0022 mg/l) during this September 2019 event. Cobalt does not have an MCL; however, the TDEC-DSWM uses the EPA regional screening level (RSL) of 0.006 mg/l as the groundwater protection standard for this constituent. The reported cobalt detection at upgradient well MW-1 was above the RSL for cobalt during this September 2019 event. However, the reported cobalt concentrations in downgradient MW-5 and TMW-3 were below the RSL for cobalt concentrations during this September 2019 event. Cobalt has historically been detected at concentrations that exceed the RSL at MW-1 prior to the disposal of waste in the landfill, and total cobalt was detected in MW-1 at similar concentrations during previous events. For this site, the presence of cobalt in the local groundwater is considered to be naturally occurring, originating from deposits in the soil overburden, since there is no immediate development up-gradient of MW-1.

**Total Chromium** was detected in MW-5 (0.00583 mg/l), TMW-2 (0.00333 mg/l), and TMW-3 (0.00547 mg/l). These values were not above the MCL of 0.1 mg/l for chromium.

**Total Mercury** was detected in up-gradient well MW-1 (total mercury = 0.00108 mg/l) during this September 2019 monitoring event, which was below the MCL of 0.002 mg/l for mercury concentrations, but higher in concentration than the previous June 2019 event (total mercury = 0.000889 mg/l) at MW-1. Total mercury was not detected above the laboratory PQL (0.000200 mg/l) at any of the down-gradient wells during this September 2019 event. During the June 2018 event, total mercury was detected above the MCL at MW-1 (total mercury=0.00319 mg/l), which was the first time the total mercury concentration has exceeded the MCL at MW-1. The lower limit for the 95% confidence interval about the mean for mercury at MW-1 (incorporating the mercury concentrations for the last 10 events, using Regression on Order Statistics with 3 non-detects) is 0.0003 mg/L. This is well below the MCL for mercury. Total mercury has historically been detected above the laboratory PQL (0.0002 mg/l) at up-gradient well MW-1 at concentrations ranging from 0.00024 mg/l (February 2011) to 0.00108 mg/l (September 2019). Although total mercury has been previously detected above the PQL at up-gradient MW-1, total mercury has not been detected above the laboratory PQL in any of the down-gradient monitoring wells since monitoring began at the site in 2008. The presence of mercury in the local groundwater near up-gradient monitoring well MW-1 may be attributable to naturally occurring deposits in the soil

overburden, since there is no immediate development up-gradient of MW-1. The observed concentrations of mercury at MW-1 will continue to be monitored in future monitoring events.

#### 4.2.2 EWS Groundwater Quality Relative to the National Secondary Drinking Water Standards

Laboratory analytical results for the groundwater samples collected in September of 2019 from the former EWS Class II Landfill groundwater monitoring well network indicated that three of the site-specific groundwater-monitoring list of compounds were detected at concentrations that exceeded the National Secondary Drinking Water Standards (2DWS). Those parameters include **aluminum** in down-gradient wells MW-5, TMW-1, TMW-2, and TMW-3, **iron** in up-gradient well MW-1 and down-gradient wells MW-4, MW-5, TMW-1, TMW-2, and TMW-3, and **manganese** in up-gradient well MW-1 and down-gradient wells MW-3, MW-5, and TMW-3. Chloride, sulfate, and nickel detections were below the 2DWS during this event. The observed concentrations for the constituents given below are discussed relative to the 2DWS.

**Total Aluminum** concentrations observed in MW-5 (0.248 mg/l), TMW-1 (0.215 mg/l), TMW-2 (1.02 mg/l) and TMW-3 (1.51 mg/l) during the September 2019 sampling event were above the 2DWS (0.2 mg/l). Observed aluminum concentrations were higher than the previous June 2019 sampling event at MW-5 (<0.1 mg/l), TMW-2 (0.436 mg/l), and TMW-3 (<0.1 mg/l). Aluminum concentrations were lower than the previous June 2019 sampling event at TMW-1 (0.238 mg/l). Aluminum was not detected above the PQL (<0.1 mg/l) at MW-1, MW-3, or MW-4 during this September 2019 event.

Sampling data suggests that total aluminum concentrations are sensitive to turbidity values, given that the dissolved aluminum concentrations at MW-5, TMW-1, and TMW-3 were less than the laboratory PQL (<0.1 mg/l). TMW-2 was the only sampling location with a dissolved aluminum concentration (0.229 mg/l) and total aluminum concentration (1.02 mg/l) that was above the laboratory PQL (0.1 mg/l) or MCL (0.2 mg/l). The total aluminum detections were likely affected by the turbidity at the time of sampling at MW-5 (17.0 NTU), TMW-1 (33.6 NTU), TMW-2 (97.3 NTU), and TMW-3 (176.0 NTU).

The **Chloride** concentrations reported at MW-1 (2.84 mg/l), MW-3 (17.9 mg/l), MW-4 (8.85 mg/l), MW-5 (88.9 mg/l), TMW-1 (17.6), TMW-2 (22.9 mg/l), and TMW-3 (61.6 mg/l) during this September 2019 event were below the 2DWS for chloride concentrations (250 mg/l). The current September 2019 chloride concentration at MW-3 is slightly lower compared to the June 2019 event (23.9 mg/l). The current chloride concentrations for the September 2019 event is slightly higher than the June 2019 event at wells MW-1 (2.15 mg/l), MW-4 (8.4 mg/l), MW-5 (83.5 mg/l), TMW-1 (16.7 mg/l), TMW-2 (19.6 mg/l), and TMW-3 (59.4 mg/l). However, the chloride concentration at MW-3 during this event continues to be significantly lower in concentration compared to the previous December 2018 event (65 mg/l), September 2018 event (222 mg/l), November 2015 (458 mg/l) event, and the supplemental re-sampling event (360 mg/l) in December 2015. Chloride concentrations at MW-3 have remained below the 250 mg/l 2DWS for chloride during the March 2019, June 2019, and September 2019 events. In addition, the chloride concentration at MW-3 during this event was lower than the twenty-two monitoring

events from July 16, 2010 to December 4, 2018. Although the chloride concentrations reported at MW-5 have remained below the 2DWS for chloride concentrations, the chloride concentrations at MW-5 appear to be increasing slightly since November 2016, based on the time-series graphs. The observed increase in the chloride concentration at MW-5 during this event is noted, and chloride concentrations at MW-3 and MW-5 will continue to be evaluated.

**Total Iron** was detected above the 2DWS (0.3 mg/l) in up-gradient well MW-1 (15.5 mg/l) and down-gradient wells MW-4 (1.75 mg/l), MW-5 (0.4 mg/l), TMW-1 (0.356 mg/l), TMW-2 (1.63 mg/l), and TMW-3 (5.64 mg/l) during the September 2019 monitoring event. The reported total iron concentrations at each of the groundwater monitoring wells were less than the highest concentrations observed prior to placement of waste and do not exhibit a trend via time-series graphs. The presence of iron in the local groundwater is considered to be naturally occurring, originating from deposits in the soil overburden, and iron has consistently been detected above the 2DWS in up-gradient well MW-1.

**Total Manganese** has been consistently detected at concentrations above the 2DWS (0.05 mg/l) in up-gradient well MW-1. Manganese detections were observed above the 2DWS (0.05 mg/l) in up-gradient MW-1 (1.05 mg/l) and down-gradient wells MW-3 (0.462 mg/l), MW-5 (0.224 mg/l), and TMW-3 (0.0563 mg/l) during the September 2019 monitoring event. The presence of total manganese in the local groundwater is considered to be naturally occurring, originating from deposits in the soil overburden.

**Total Nickel** was detected in up-gradient well MW-1 (0.00686 mg/l) and down-gradient wells MW-3 (0.00799 mg/l), MW-5 (0.00873 mg/l), and TMW-3 (0.00234 mg/l) during the September 2019 sampling event, and these values were not above the MCL value obtained from the Tennessee Division of Water Resources (TN DWR) Public Water Systems chapter rule 0400-45-01-.06 (0.10 mg/l). Total nickel has been detected at concentrations above the TN DWR Public Water Systems MCL (0.1 mg/l) in up-gradient well MW-1 during previous events on April 9, 2009 (total nickel at MW-1=0.2 mg/l) and May 19, 2009 (total nickel at MW-1=0.17 mg/l). Therefore, the presence of total nickel in the local groundwater is considered to be naturally occurring, originating from deposits in the soil overburden. The observed total nickel concentration at MW-3 during this event was lower in concentration compared to the June 2019 event (0.0397 mg/l).

The **Sulfate** concentration reported at MW-3 (154 mg/l) during this sampling event was below the 2DWS for sulfate (250 mg/l). Also, the sulfate concentration at MW-3 during this event was lower in concentration than the previous June 2019 event (219 mg/l), the December 2018 event (324 mg/l), and the September 2018 event (484 mg/l). The September 2018 event was the first time the sulfate concentration at MW-3 was above the 2DWS. Prior to September 2018, the sulfate concentration at MW-3 had remained below the 2DWS during previous events in June 2018 (30.1 mg/l), December 2017 (46.2 mg/l), September 2017 (46.2 mg/l), and June 2017 (93.7 mg/l) monitoring events. For further comparisons, the detected sulfate concentration at MW-3 was 34 mg/l in November 2016, 95.7 mg/l in August 2016, and 105 mg/l in March 2017. Prior to August 2016, the reported sulfate concentrations at MW-3 ranged from <5 mg/l to 29.1 mg/l.

Sulfate was also detected in MW-5 (8.17 mg/l), which was just above the laboratory PQL of 5.00 mg/l during this September 2019 event. Sulfate was not detected above the PQL of 5.00 mg/l in any of the other monitoring wells across the site.

**Total Magnesium** does not currently have an established MCL, 2DWS, EPA RSL, or an approved alternate groundwater protection standard (GWPS). The total magnesium concentration at MW-3 during this September 2019 event was 13 mg/l, which was lower than the previous June 2019 event concentration (20.8 mg/l), December 2018 event concentration (36.4 mg/l), and September 2018 event concentration (64 mg/l). However, the magnesium concentration at MW-3 during this sampling event was higher than the March 2019 event concentration (7.83 mg/l). Before the September 2018 event, the highest total magnesium concentration observed at MW-3 was 31.9 mg/l during the November 2015 monitoring event, and total magnesium concentrations have remained below 31.9 mg/l at MW-3 in recent groundwater events from November 2015 to June 2018.

### 4.3 QUALITY CONTROL QUALIFIER CODES

The EPA Contract Laboratory Program states that sample and result qualifiers should be utilized as part of a total quality-control process. Pace complies with this directive and reports all qualifiers along with explanations of QC qualifier codes. Ten QC qualifier codes (B, E, J, J3, J4, J6, P, P1, T8, and V) were indicated during the laboratory analysis of samples collected in September 2019. Six qualifier codes (B, E, J, J4, J6, and P1) were indicated during the laboratory analysis of groundwater samples. Five QC qualifier codes (E, J, P, P1, and V) were indicated during the laboratory analysis of the IWC leachate sample. Eight QC qualifier codes (B, E, J, J3, J6, P1, T8, and V) were indicated during the laboratory analysis of the APWC leachate sample. Specific information concerning each laboratory QC qualifier code can be found in the Laboratory Analytical Reports in Appendix C (Page 58 of 61 in the Groundwater Analytical Report, Page 28 of 30 in the IWC Leachate Analytical Report, and Page 24 of 26 in the APWC Leachate Analytical Report).

## 5.0 STATISTICAL ANALYSIS

### 5.1 APPLICABLE METHODS

The Rules of the Tennessee Department of Environment and Conservation, Division of Solid Waste Management Chapter 1200-1-7-.04 state, in part, that each landfill must conduct and report statistical analyses as part of the evaluation of groundwater monitoring data. Statistical analyses of the sampling data was performed on monitoring wells MW-1, MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3.

The solid waste rules require groundwater sample results and associated statistical methods used to determine the statistical background of a groundwater detection/assessment monitoring program be “protective of human health and the environment”. Furthermore, the rules require that the results be “representative” of the background groundwater quality of the geologic formation(s) being monitored. Various influences may affect the representativeness of sample results, which include possible errors in sampling. As previously discussed, reported total metals concentrations are likely affected by elevated turbidity values and would not be representative of the natural groundwater conditions. Before statistical evaluations were completed, the turbidity values which were collected during historical groundwater sampling events were evaluated for elevated turbidity values (>150 NTU). If the turbidity value at the time of sample collection at any given location was greater than 150 NTUs, the total metals concentrations for each sample location would not be representative of natural groundwater conditions. As a result, the corresponding data were removed from the background data set.

After the non-representative background sample data were removed, the distribution of the data was evaluated for normality. The test for normality was conducted using the Shapiro-Wilks method if  $N < 50$  or Shapiro-Francia method if  $N > 50$ . The normality test was performed for both raw and log-transformed data, with replacement of non-detects to half of the corresponding laboratory PQL. Data determined to be normally distributed were evaluated using parametric prediction limit (PPL) analysis. Inter-well and intra-well (intra-well utilized for upgradient MW-1) statistical methods were appropriately utilized to determine statistically significant increases in constituent concentrations.

Intra-well analyses was utilized only at MW-1 to compare the concentrations observed during the current groundwater-sampling event to the established background data set for MW-1 concentrations. Intra-well PPL and non-parametric statistical methods were appropriately utilized to determine statistically significant changes in background water quality data in up-gradient monitoring well MW-1. The arsenic, cobalt, and chloride data at MW-1 were normally distributed using the Shapiro-Wilks test for normality. Therefore, intra-well PPL analysis was performed for the arsenic, cobalt, and chloride data sets that passed normality testing. However, all other data sets (barium, nickel, and mercury data) for MW-1 were not normally distributed and were evaluated using intra-well non-parametric statistical methods.

Inter-well analyses compared the concentrations observed at the down-gradient monitoring locations (MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3) to the concentrations observed at the up-gradient monitoring location (MW-1) during this monitoring event. Chloride data distribution tests from all up-gradient and down-gradient monitoring wells indicated normality when the data were log-transformed and non-detects were replaced by half of the corresponding PQL. Therefore, the chloride data at MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3 were evaluated using PPL inter-well analysis. All other data sets (aluminum, barium, total cadmium, chromium, cobalt, copper, fluoride, nickel, zinc, and sulfate data) at all up-gradient and down-gradient monitoring wells were not normally distributed and were evaluated using non-parametric statistical methods.

The percentage of inter-well non-detects for each parameter determined the primary statistical method utilized. If the percentage of non-detects in the samples was less than 50%, Shewart-CUSUM control charts were utilized. If at least 50% non-detects existed for the given parameter, non-parametric inter-well prediction limit analysis was conducted on the data. For this site, the total % non-detects for aluminum (38.05% non-detects) and barium (0% non-detects) were less than 50%, and Shewart-CUSUM control charts were utilized for aluminum and barium analysis. Based on the high amount of left-censored data ( $\geq 50\%$  of non-detects) for total cadmium, chromium, cobalt, copper, lead, fluoride, nickel, vanadium, zinc, and sulfate, non-parametric inter-well prediction limit analysis was conducted for the background data from up-gradient well MW-1 compared to down-gradient monitoring wells (MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3). Additional statistical procedures performed included Mann-Kendall trend analyses and the non-parametric Wilcoxon Rank Sum group comparisons (with non-detects set to the highest reporting limit for the given constituent analyzed). The Wilcoxon Rank Sum non-parametric inter-well analysis was conducted as a confirmation test for any parameter that failed the above-mentioned statistical analysis methods for final determination of a statistical increase.

The computer program ChemStat was used for all statistical computations. Worksheets for inter-well and intra-well statistical analysis and time versus concentration charts are given in Appendix B – Statistical Evaluations and Time Series Plots.

## **5.2 STATISTICAL RESULTS**

A statistically significant increase (SSI) in reported cobalt concentrations were identified in up-gradient well MW-1 using intra-well non-parametric prediction limit analysis. No other SSIs were identified in up-gradient well MW-1 during this event.

SSIs over background identified for the current monitoring event include total cadmium at MW-3, chloride at MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3, fluoride at MW-3, sulfate at MW-3, and zinc at MW-3. Trend analyses revealed a statistically significant upward trend in total cadmium, chloride, fluoride, sulfate, and zinc concentrations reported at MW-3. In addition, trend analyses revealed a statistically significant upward trend in total barium, chloride, chromium, and sulfate at MW-5. A statistically significant upward trend in chloride concentrations was reported at TMW-1, TMW-2, and TMW-3.

Trend analyses revealed a statistically significant downward trend in aluminum at MW-3. There were no distinct statistically significant trends in total barium, chromium, cobalt, or nickel concentrations reported at MW-3. In addition, trend analysis revealed a downward trend in total barium concentrations at MW-4 and a downward trend in total aluminum concentrations at TMW-2.

The statistical trend analysis for total cadmium at MW-3 does confirm an increasing trend having statistical significance when considering all current and past data for cadmium at MW-3. However, no distinct statistically significant trend was identified for total cadmium concentrations at MW-3 when considering data from the past 10 sampling events since June 2017. The total cadmium concentrations reported at MW-3 during this sampling event on September 6, 2019 (0.0088 mg/l and 0.00822 mg/l in duplicate sample) were lower in concentration than the previous June 4, 2019 event (0.0292 mg/l and 0.0288 mg/l in duplicate sample) and March 5, 2019 event (0.0117 mg/l and 0.0113 mg/l in duplicate sample).

The chloride concentrations observed at MW-3 (17.9 mg/l), MW-4 (8.85 mg/l), MW-5 (88.9 mg/l), TMW-1 (17.6 mg/l), TMW-2 (22.9 mg/l), and TMW-3 (61.6 mg/l) produced a SSI over background during this event. The chloride detections at MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3 are consistent with previous data and are below the 2DWS for chloride concentrations (250 mg/l). When considering all chloride data to date from MW-4, the data do not show an upward or downward trend in chloride concentrations using the Mann-Kendall trend analysis at the 95% confidence level. However, the chloride concentrations observed at MW-3, MW-5, TMW-1, TMW-2, and TMW-3 indicated an upward trend in chloride concentrations using the Mann-Kendall trend analyses at the 95% confidence level.

The chromium concentrations observed at MW-5 (0.00583 mg/l), TMW-2 (0.00333 mg/l), and TMW-3 (0.00547 mg/l) were less than the MCL (0.1 mg/l), and did not produce a SSI in reported concentrations during this event.

The fluoride concentration at MW-3 (0.306 mg/l) was less than the MCL (4.0 mg/l) during this event. When considering all data accumulated from MW-3 since January 21, 2009, a statistically significant upward trend in fluoride concentrations at MW-3 was indicated using the Mann-Kendall trend analysis at the 95% confidence level. The fluoride detection at MW-3 in September 2018 was higher than the previous ten sampling events.

A SSI in reported sulfate concentrations at MW-3 was identified during this sampling event. In addition, when considering all data accumulated from MW-3 since May 19, 2009, a statistically significant upward trend in sulfate concentrations at MW-3 was indicated using the Mann-Kendall trend analysis at the 95% confidence level. The sulfate concentration reported during this sampling event (154 mg/l) was lower than the previous June 2019 event (219 mg/l) but higher than the March 2019 event (85.8 mg/l). Regardless, the concentration remains below the 2DWS of 250 mg/l. Also, the observed sulfate concentration during this event is lower than the previous December 2018 event (324 mg/l) and the previous September 2018 event (484 mg/l). The sulfate

concentrations observed at MW-3 had remained below the 2DWS during all previous monitoring events prior to September 2018. Sulfate was also detected in MW-5 (8.17 mg/l) during this September 2019 event, which was well below the 2DWS of 250 mg/l. Sulfate was not detected above the PQL in any of the other monitoring wells across the site. While there was an upward trend in sulfate concentrations identified in MW-5 during this event, there was no reported SSI.

A SSI in reported total zinc concentrations at MW-3 was identified during this sampling event, and the statistical trend analysis for total zinc at MW-3, using all detected zinc data including data from this September 2019 event (0.0324 mg/l), confirmed an increasing trend having statistical significance. The zinc concentration at MW-3 during this event was lower than the previous June 2019 event (0.197 mg/l), March 2019 event (0.0994 mg/l), December 2018 event (1.34 mg/l), initial September 12, 2018 event (1.68 mg/l), and the subsequent re-sample event on September 27, 2018 (1.58 mg/l). The September 12, 2018 event was the highest zinc concentration reported at MW-3 since April 19, 2008. Total zinc was first detected above the laboratory PQL (<0.025 mg/l) at MW-3 during the June 2017 groundwater event (0.0769 mg/l) and was detected at MW-3 during the September 2017 event (0.0439 mg/l), December 2017 event (0.159 mg/l), and March 2018 event (0.0499 mg/l). Before June 2017, zinc had remained below the current laboratory PQL of 0.025 mg/l since July of 2010. Although zinc levels at MW-3 are above the PQL, the levels appear to be decreasing in concentration since September 2018 and are still below the 2DWS of 5 mg/l.

A summary of intra-well and inter-well statistical analysis is presented in Table 3 – Intra-Well and Inter-Well Statistical Summary in Appendix A.

## 6.0 CONCLUSIONS

The results of the third quarter assessment-monitoring event of 2019 are summarized as follows:

- SSIs over background identified for the current monitoring event include total cadmium at MW-3, chloride at MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3, fluoride at MW-3, sulfate at MW-3, and zinc at MW-3. Trend analyses revealed a statistically significant upward trend, using all concentrations detected since the beginning of the monitoring program, in total cadmium, chloride, fluoride, sulfate, and zinc concentrations reported at MW-3. In addition, trend analyses for all data revealed a statistically significant upward trend in total barium, chloride, chromium, and sulfate concentrations at MW-5. In addition, a statistically significant upward trend in chloride concentrations was reported at TMW-1, TMW-2, and TMW-3.
- The total cadmium concentration at MW-3 during this event was above the MCL. In addition, statistical trend analysis for all total cadmium concentrations detected at MW-3 since the beginning of the monitoring program does confirm an increasing trend having statistical significance when analyzing the data using the Mann-Kendall trend analysis method. However, no distinct statistically significant trend was identified for total cadmium concentrations at MW-3 using the Mann-Kendall trend analysis method when considering data only from the past 10 sampling events since June 2017. Based on current data, the impacted area appears to be limited to the MW-3 location, since there have been no cadmium detections from groundwater samples obtained from temporary monitoring wells TMW-2 and TMW-3 that are immediately down-gradient of MW-3. The cadmium concentration reported at MW-3 during this event was lower than the previous June 2019 event, March 2018 event, December 2018 event, and September 2018 event. The elevated concentrations of cadmium in September 2018 at MW-3 may have been associated with closure construction activities in and around the storm water pond located immediately adjacent to MW-3 at that time. Since construction activities are completed, the cadmium levels observed in MW-3 are expected to decrease over time.
- Total Arsenic was detected above the MCL (0.01 mg/l) at background well MW-1 (0.0176 mg/l) during this 3<sup>rd</sup> Quarter 2019 event. In addition, total arsenic was detected above the PQL (0.002 mg/l) in TMW-3 (0.00387 mg/l). During the previous 2<sup>nd</sup> Quarter 2019 event, arsenic was also detected above the MCL in MW-1 (0.0194 mg/l), but was not detected above the PQL in TMW-3. Arsenic was not detected above the MCL in any of the monitoring locations during the 1<sup>st</sup> Quarter 2019 event. The lower limit for the 95% confidence interval about the mean for arsenic at MW-1 (incorporating the arsenic concentrations for the last 10 events, using distribution fitting with the lognormal distribution as the best fit) is 0.0168 mg/L. This is above the MCL for arsenic.
- A SSI was identified for the reported sulfate concentration at MW-3, and the sulfate concentrations at MW-3 exhibited a statistically significant increasing trend. During the September 2018 and December 2018 events, the observed sulfate concentrations at

MW-3 had been above the 2DWS for sulfate (250 mg/l). However, the sulfate concentrations reported at MW-3 during the March 2019 sampling event (85.8 mg/l), June 2019 sampling event (219 mg/l), and this September 2019 sampling event (154 mg/l) have all been below the 2DWS for sulfate. Sulfate was also detected in MW-5 (8.17 mg/l) during this September 2019 event, which was well below the 2DWS. Sulfate has not consistently been detected above the PQL (5 mg/l) at any of the other permanent monitoring wells or temporary monitoring wells across the site. Although the sulfate concentration at MW-3 was below the 2DWS during this event, the observed sulfate concentration during this event was higher than the previous March 2019 event. Therefore, MW-3 will be closely monitored for increasing trends in sulfate concentrations during the next monitoring event.

- Based on the review of the time-series graphs, it appears that the concentrations of total cadmium, calcium, magnesium, manganese, nickel, potassium, zinc, chloride, and sulfate at MW-3 decreased in concentration during this third quarter monitoring event compared to the previous second quarter 2019 monitoring event, while the concentration of fluoride in MW-3 increased in concentration during this third quarter monitoring event compared to the previous second quarter 2019 monitoring event. This general decrease in constituent concentration followed a period of increase in concentration during the second quarter 2019 monitoring event compared to the first quarter 2019 event. However, a decrease in constituent concentrations was also noted during the first quarter 2019 monitoring event compared to the previous fourth quarter and third quarter 2018 monitoring events. During the third quarter 2018 event, the same above-referenced constituents at MW-3 increased in concentration compared to previous groundwater events. Specifically, the observed cadmium, calcium, fluoride, magnesium, manganese, nickel, and zinc concentrations reported at MW-3 during the September 2018 event were the highest reported concentrations of these constituents since April 19, 2008, when monitoring began at MW-3. In addition, the conductivity measured in uS/cm observed at MW-3 during the previous third quarter 2018 monitoring event was higher than previous monitoring events since the April 2016 monitoring event. However, the conductivity measurements during recent events are lower than the conductivity measurement during the third quarter 2018 monitoring event.
- The chloride concentrations at MW-1, MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3 are still well below the 250 mg/l 2DWS.
- Trend analyses revealed a statistically significant downward trend in aluminum at MW-3. There were no distinct statistically significant trends in total barium, chromium, cobalt, or nickel concentrations at MW-3. When considering all chloride data to date from MW-4, the data do not show an upward or downward trend in chloride concentrations using the Mann-Kendall trend analysis at the 95% confidence level. In addition, trend analysis revealed a downward trend in total barium concentrations at MW-4 and a downward trend in total aluminum concentrations at TMW-2. No other

statistically significant upward or downward trends in data were identified for this event.

- No VOCs were detected above their respective laboratory PQL in any of the groundwater monitoring wells during the monitoring event.

The fourth quarter 2019 assessment-monitoring event is tentatively scheduled for December 2019 and will consist of collecting groundwater samples from up-gradient well MW-1 and down-gradient wells MW-3, MW-4, MW-5, TMW-1, TMW-2, and TMW-3. Leachate samples will be collected from the APWC and IWC.

Since the former EWS Class II Landfill site remains in assessment monitoring, a private water use survey update is required annually. The previous annual water use survey for the former EWS Class II Landfill site was completed in December 2018, and no new wells or springs were identified within the approved search radius for the site during the December 2018 update. The next annual water use survey update for the former EWS Class II Landfill is scheduled to be completed in December 2019.

## 7.0 RECOMMENDATIONS

The following recommendations are presented in an effort to ensure the continuance of securing representative groundwater samples and to obtain analytical results with a high-degree of accuracy and precision (i.e., repeatability).

1. It is recommended that all permanent monitoring wells on the site continue to be monitored quarterly. In addition, quarterly groundwater samples will continue to be collected from temporary monitoring wells down-gradient from MW-3.
2. It is recommended that the chosen analytical laboratory (Pace) continue to analyze for total metal constituents using methods that will produce the lowest reporting limit. Additional sampling analysis for dissolved metals will not be necessary if sample turbidities are below 10 NTUs, considering recent analytical data has shown that total and dissolved metals concentrations have been similar when samples have turbidities below 10 NTUs, and sampling for dissolved metals analysis (in addition to total metals) is not standard protocol when sample turbidities are low. If certain groundwater samples have turbidities that are above 10 NTUs (observed primarily in temporary monitoring wells TMW-1, TMW-2, and TMW-3), samples may be collected for dissolved metals analysis (in addition to total metals analysis).
3. It is recommended that total metals sample data will continue to be removed from the background data set for statistical evaluations if elevated turbidity values are observed during sample collection.

<sup>1</sup> Top of Casing Elevations from survey by Civil & Environmental Consultants, Inc. on May 12, 2016.

<sup>2</sup> Depth to water measurements collected by Civil & Environmental Consultants, Inc. on September 5, 2019.

\* - MW-2 has been removed from monitoring network. Only water level and field parameters collected at MW-2.

\*\* Dissolved Oxygen at MW-2 was unable to be measured due to field sampling error.

NS= Not Sampled

NA= Not Applicable.

Notes:

MCL: Maximum Contaminant Level Enforceable National Primary Drinking Water Standards

GWPS: Groundwater Protection Standard

<sup>1</sup> - MCL value obtained from TN Division of Water Supply rule 1200-5-.06(1)(b)11

<sup>2</sup> - MCL value obtained from TN Division of Water Supply rule 1200-5-1-.12(1)(n). (EPA Secondary Drinking Water Standard)

<sup>3</sup> - GWPS value is referenced from EPA Regional Screening Level for Cobalt

NS- Not Sampled for analysis.

NA-Not Analyzed by the Laboratory.

**Dark gray shaded text indicates detection above respective MCL/GWPS**

**Light gray shaded text indicates detection above respective Non-Enforceable National Secondary Drinking Water Standard.**

B-The same analyte is found in the associated blank.

P- RPD between the primary and confirmatory analysis exceeded 40%.

J3 - The associated batch QC was outside the established quality control range for precision.

J4 - The associated batch QC was outside the established quality control range for accuracy.

T8- Sample(s) received past/too close to holding time expiration

---

The Wilcoxon Statistic is 589

The Expected value is 325

The Standard Deviation is 53.0723

The Z Score is 4.96493

The Standard Deviation adjusted for ties is 52.2494

The Z Score adjusted for ties is 5.04312

**4.96493 > 2.326 indicating statistical significance at 1% level**

**5.04312 > 2.326 indicating statistical significance at 1% level when adjusted for ties**

## Civil & Environmental Consultants - TN

Sample Delivery Group: L1136558  
Samples Received: 09/06/2019  
Project Number: 181-364  
Description: Former EWS Camden Class 2 Landfill  
Site: CAMDEN, TN  
Report To: Philip Campbell  
117 Seaboard Ln.  
Suite E100  
Franklin, TN 37067

Entire Report Reviewed By:

Chris McCord  
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

|                              |  |
|------------------------------|--|
| MDL                          | Method Detection Limit.  |
| ND                           | Not detected at the Reporting Limit (or MDL where applicable).   |
| RDL                          | Reported Detection Limit.  |
| Rec.                         | Recovery.  |
| RPD                          | Relative Percent Difference.   |
| SDG                          | Sample Delivery Group.   |
| (S)                          | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.   |
| U                            | Not detected at the Reporting Limit (or MDL where applicable).   |
| Analyte                      | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.   |
| Dilution                     | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.  |
| Limits                       | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.  |
| Original Sample              | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.  |
| Qualifier                    | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.  |
| Result                       | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma.   |
| Case Narrative (Cn)          | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.  |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.  |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.  |
| Sample Results (Sr)          | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.   |
| Sample Summary (Ss)          | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.  |

| Qualifier | Description   |
|-----------|---|
| B         | The same analyte is found in the associated blank.  |
| E         | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J         | The identification of the analyte is acceptable; the reported value is an estimate.   |
| J4        | The associated batch QC was outside the established quality control range for accuracy.   |
| J6        | The sample matrix interfered with the ability to make any accurate determination; spike value is low.                                       |
| P1        | RPD value not applicable for sample concentrations less than 5 times the reporting limit.   |

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

\* Not all certifications held by the laboratory are applicable to the results reported in the attached report.  
 \* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

## State Accreditations

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

|                              |  |
|------------------------------|--|
| MDL                          | Method Detection Limit.  |
| ND                           | Not detected at the Reporting Limit (or MDL where applicable).   |
| RDL                          | Reported Detection Limit.  |
| Rec.                         | Recovery.  |
| RPD                          | Relative Percent Difference.   |
| SDG                          | Sample Delivery Group.   |
| (S)                          | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.   |
| U                            | Not detected at the Reporting Limit (or MDL where applicable).   |
| Analyte                      | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.   |
| Dilution                     | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.  |
| Limits                       | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.  |
| Original Sample              | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.  |
| Qualifier                    | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.  |
| Result                       | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma.   |
| Case Narrative (Cn)          | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.  |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.  |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.  |
| Sample Results (Sr)          | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.   |
| Sample Summary (Ss)          | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.  |

| Qualifier | Description   |
|-----------|---|
| E         | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J         | The identification of the analyte is acceptable; the reported value is an estimate.   |
| P         | RPD between the primary and confirmatory analysis exceeded 40%.   |
| P1        | RPD value not applicable for sample concentrations less than 5 times the reporting limit.   |
| V         | The sample concentration is too high to evaluate accurate spike recoveries.   |

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

\* Not all certifications held by the laboratory are applicable to the results reported in the attached report.  
 \* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

## Civil & Environmental Consultants - TN

Sample Delivery Group: L1139696  
Samples Received: 09/13/2019  
Project Number: 181-364  
Description: EWS Camden Class 2 Landfill  
Site: CAMDEN, TN  
Report To: Philip Campbell  
117 Seaboard Ln.  
Suite E100  
Franklin, TN 37067

Entire Report Reviewed By:

Jason Romer  
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

|                              |  |
|------------------------------|--|
| MDL                          | Method Detection Limit.  |
| ND                           | Not detected at the Reporting Limit (or MDL where applicable).   |
| RDL                          | Reported Detection Limit.  |
| Rec.                         | Recovery.  |
| RPD                          | Relative Percent Difference.   |
| SDG                          | Sample Delivery Group.   |
| (S)                          | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.   |
| U                            | Not detected at the Reporting Limit (or MDL where applicable).   |
| Analyte                      | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.   |
| Dilution                     | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.  |
| Limits                       | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.  |
| Original Sample              | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.  |
| Qualifier                    | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.  |
| Result                       | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma.   |
| Case Narrative (Cn)          | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.  |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.  |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.  |
| Sample Results (Sr)          | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.   |
| Sample Summary (Ss)          | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.  |

| Qualifier | Description   |
|-----------|---|
| B         | The same analyte is found in the associated blank.  |
| E         | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J         | The identification of the analyte is acceptable; the reported value is an estimate.   |
| J3        | The associated batch QC was outside the established quality control range for precision.  |
| J6        | The sample matrix interfered with the ability to make any accurate determination; spike value is low.                                       |
| P1        | RPD value not applicable for sample concentrations less than 5 times the reporting limit.   |
| T8        | Sample(s) received past/too close to holding time expiration.   |
| V         | The sample concentration is too high to evaluate accurate spike recoveries.   |

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

\* Not all certifications held by the laboratory are applicable to the results reported in the attached report.  
 \* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

**APPENDIX D**  
**CEC STANDARD OPERATING PROCEDURES**

---

## 03-02-01 MONITORING WELLS USING CONVENTIONAL PURGING

**I. SCOPE AND APPLICABILITY:** This procedure is applicable to the sampling of monitoring wells which do not contain free product using conventional purge methodology.

### II. PROJECT-SPECIFIC REQUIREMENTS

**A. SAMPLE LOCATIONS AND NUMBERING SYSTEM:**

**B. ANALYTICAL PARAMETERS AND SAMPLE FREQUENCY:**

**C. FIELD SCREENING AND ANALYSES:** *Reference appropriate SOPs.*

**D. QUALITY ASSURANCE SAMPLES:** *Number and type of blanks and duplicates. Reference SOPs 04-01-01, 04-01-02, and 04-02-01 as appropriate.*

**E. FILTRATION:**

**F. PURGE CRITERION AND DISPOSAL OF PURGE WATER:**

**G. WELL KEYS:** *Indicate whether wells use CEC's standard key*

**H. DEDICATED EQUIPMENT:** *Indicate whether dedicated pumps or bailers have been installed.*

**I. OTHER REQUIREMENTS:**

**III. METHODOLOGY:** Monitoring wells should be sampled progressing from least contaminated to most contaminated to reduce the chances of cross contamination between samples. If a bailer is employed, use new rope for each well.

**A. PURGING:** Purging is performed to remove static water standing in the well bore, thereby allowing collection of a sample representative of water in the aquifer. Unless otherwise specified in Section II.F., well development may suffice for the purge, so long as the sample is collected immediately following development.

1. Measure the water level from the top of the riser pipe at the pre-marked reference point (SOP 06-01-01).

2. Calculate the purge volume using the data presented in Exhibit 03-02-01 and the criterion presented in Section II.F.

3. Remove the required volume of water using one of the following methods. If the well goes dry, the purge can be considered complete unless otherwise specified in Section II.F. However, attempts should be made to prevent the well from going dry during purging, drying the well disrupts the flow regime and can result in the loss of volatile compounds. Therefore:

≡ If a well is known to have a low yield, it should be purged by bailing.

≡ If a pump is used for purging, adjust the pumping rate to maintain a water column in the well, if possible.

≡ Do not attempt to purge a well to dryness unless it is infeasible to maintain water in the well at a reasonable purge rate.

**METHOD A:** If the purge criterion is specified on volume of water to be removed:

- a. Remove the required volume of water using a submersible pump or bailer. If a pump is used, a check valve must be installed on the pump to prevent pumped water from returning to the well. Begin purging at the top of the water column. Minimize aeration of the water during purging by pumping at a low rate or lowering the bailer gently into the water.
- b. Lower the pump or bailer as necessary to continue purging until the well volume criterion is met.

**METHOD B:** If the purge criteria are specified on stabilization of field analyses:

- a. Measure initial water quality by retrieving a sample from the top of the water column using a bailer. Conduct the field analyses specified in Section II.F. Record these results on the Groundwater Monitoring Data Sheet (SOP 07-02-01).
- b. Remove one well volume of water by submersible pump or bailer. If a pump is used, a check valve must be installed to prevent water from returning to the well. Begin purging at the top of the water column. Minimize aeration of the water during purging by pumping at a low rate or lowering the bailer gently into the water.
- c. After one well volume has been removed, conduct field analyses on the groundwater being discharged. Record results on the Monitoring Sampling Data Sheet.
- d. Repeat steps b and c until the purge criteria have been met.

**B. SAMPLE COLLECTION:** Groundwater samples should be collected immediately after purging, if the well will yield sufficiently. Some low-yielding wells may require time to recover prior to sampling. If the well will not yield a sample immediately after purging, a maximum of 24 hours between purging and sampling is permitted.

1. Collect water from the well by slowly lowering a decontaminated bailer into the water column.
2. Transfer the samples which do not require filtering directly into sample bottles in the following order:

    Volatile Organic Compounds  
    Semi-Volatile Organic Compounds  
    Pesticides and PCBs  
    Cations and Anions  
    Radionuclides  
    Bacteria.

3. If indicated in Section II.E., filter the required aliquots (SOP 05-03-02 or 05-03-03) and fill those sample bottles.

4. Preserve the samples immediately in accordance with SOP 07-01-02.
5. Conduct field analyses: pH (SOP 05-04-01 or 05-04-04), temperature, specific conductance (SOP 05-04-02), dissolved oxygen (SOP 05-04-03), Eh (SOP 05-04-08), and any other parameters listed in Section II.C.
6. If a dedicated sample bailer was used, return it to the well head. Otherwise, decontaminate the bailer as specified in SOP 01-01-00.
7. Replace the well cap and lock the protective casing.
8. Collect quality-assurance samples specified in Section II.D in accordance with SOP 04-01-01, 04-01-02, and 04-02-01.
9. Decontaminate samples in accordance with SOP 01-01-00.
10. Pack and ship the samples in accordance with SOP 07-01-03. Samples should be shipped on a daily basis and such that holding time requirements (SOP 07-01-02) can be met.

**IV. PRECAUTIONS AND COMMON PROBLEMS**

- A. When using a bailer, do not allow the rope to drag on the ground. If necessary, lay out plastic sheeting to catch the rope.
- B. When using a pump, exercise caution to prevent cross-contaminating samples with the hose. Do not sample from the pump discharge for trace organic compounds. Always use a check valve if not using a dedicated hose. Discard hose if there is a question about whether it can be adequately decontaminated.
- C. Check the holding times on the analyses to be conducted. The holding time for some parameters is 24 hours. Plan sampling and shipping of these samples accordingly.
- D. Preserve samples immediately after collection, including keeping them cool. Do not let samples sit in a hot vehicle until the end of the day.

**V. DOCUMENTATION**

- A. Record information on a Groundwater Monitoring Data Sheet (SOP 07-02-01).
- B. Prepare a Trip Report (SOP 07-02-04) and include:
  - ≡ Time, date, and method of sample shipment
  - ≡ Preservation methods and sample handling
  - ≡ Description of purge and sampling methods
  - ≡ The Groundwater Monitoring Data Sheet.

**VII. REFERENCES**

None

## 04-01-01 EQUIPMENT BLANKS

**I. SCOPE AND APPLICABILITY:** Equipment blanks are collected to assess the adequacy of decontamination procedures and to determine whether sampling equipment and methods are contributing contaminants to samples.

**II. PROJECT-SPECIFIC REQUIREMENTS:**

**WATER TYPES TO BE USED FOR BLANKS:** [*distilled water, deionized water, HPLC-grade water, etc.*]

**III. METHODOLOGY**

A. Review the SOP for the medium sampled to establish the frequency for collection of blanks.

B. Assemble a complete set of decontaminated sampling equipment for the subject sampling effort.

C. Rinse the blank water across the sampling equipment, catching it in a decontaminated stainless-steel bucket. Handle the water in the same manner as the samples. For example, if samples for metals analysis are to be filtered with a disposable filter, the blank aliquot for metals analysis should be processed through a new disposable filter. Blanks for soil sampling may be run across the split-spoon sampler, trowel, and bucket.

D. Fill a complete set of sample bottles.

E. Assign the blank a sample number of the same format as the other samples in the series.

F. Store, handle, and ship the blanks in the same manner as the samples.

**IV. PRECAUTIONS AND COMMON PROBLEMS**

A. The selection of stock solution depends upon the requirements of the project. Analyses for trace contaminants will require a purer blank solution than analyses for major constituents. Stringent analytical requirements will necessitate the use of laboratory-supplied blank water.

B. Include ALL sampling equipment in the rinsing procedure.

**V. DOCUMENTATION:** Record the following information in the field logbook:

- ≡ Source of blank water
- ≡ Time and sequence within the sampling event when the blanks were prepared
- ≡ Description of the procedure for preparing the blanks
- ≡ Sample numbers assigned to blanks.

Incorporate this information into the Trip Report (SOP 07-02-04).

**VI. REFERENCES**

EPA, 1986. Test Methods for Evaluating Solid Waste: SW-846; Volume II. Washington, DC.

## 04-01-02 TRIP BLANKS

**I. SCOPE AND APPLICABILITY:** Trip blanks are prepared to evaluate whether volatile constituents have migrated into samples from the air on-site, during shipping, or at the laboratory.

**II. PROJECT-SPECIFIC REQUIREMENTS:**

A. Frequency:

B. Other Criteria:

**III. METHODOLOGY**

A. When ordering bottles from the laboratory for the sampling event, request that trip blanks be sent also.

B. Keep the supplied blanks with the samples being collected throughout the sampling event. Handle the blanks in the same manner as the filled sample vials.

C. Assign the trip blank a sample number of the format used for the sampling event.

D. Return the trip blanks to the laboratory with the samples. Include the samples on the Chain-of-Custody form (SOP 07-02-02). Analysis is typically performed for volatile organic compounds only.

**IV. PRECAUTIONS AND COMMON PROBLEMS:** None.

**V. DOCUMENTATION:** Describe handling on the trip blanks in the Trip Report (SOP 07-02-04). Include the sample numbers assigned.

**VI. REFERENCES**

EPA, 1986. Test Methods for Evaluating Solid Waste: SW-846; Volume II. Washington, DC.

## 04-02-01 LIQUID DUPLICATES

**I. SCOPE AND APPLICABILITY:** Duplicate samples are collected to evaluate the precision involved in the sampling effort. Duplicate samples must be collected to be as similar as possible to the original sample. This procedure is applicable of collection of duplicate samples of all liquids and flowable sludges.

**II. PROJECT-SPECIFIC REQUIREMENTS:**

**NUMBER/FREQUENCY OF DUPLICATE SAMPLING:**

**DUPLICATE NUMBERING SYSTEM:** *[Indicate how sample numbers are to be assigned to duplicates, and whether “blind” numbers should be assigned.]*

**III. METHODOLOGY**

A. Prepare sample bottles for the target sample and its duplicate.

B. Collect the liquid sample in accordance with the appropriate SOP.

C. When filling sample bottles, fill each type of bottle for the sample and duplicate in sequence. Fill both VOA vials, then both metals bottles, etc. This will assure that the duplicate is as similar to the original sample as possible.

D. Preserve the sample and duplicate identically.

**IV. PRECAUTIONS AND COMMON PROBLEMS**

A. Failure to fill bottles alternately between the sample and duplicate may result in poor reproducibility between analyses.

B. Samples with free product or multiple phases present special problems. The phase distribution must be the same in both aliquots.

**V. DOCUMENTATION:** List the sample and duplicate on the Groundwater Monitoring Data Sheet as separate samples, describing the duplicate in the “Comments” column. If a Groundwater Monitoring Data Sheet is not appropriate, incorporate this information into the Trip Report (SOP 07-02-04).

**VI. REFERENCES:** None.

## **05-03-05 BAILER**

**I. EQUIPMENT SPECIFICATION:** This procedure is applicable to the use of all bottom-fill bailers.

### **II. INSPECTION AND CALIBRATION**

**A. DAILY INSPECTION AND CHECKS:** Make sure fittings at both ends of the bailer are secure. Assure that the check valve opens and closes freely.

**B. CALIBRATION:** There is no calibration applicable to this equipment.

**C. ROUTINE MAINTENANCE:** There is no maintenance applicable to this equipment. Bailers are typically replaced if damaged.

### **III. USE**

A. Select a rope or cable for suspension of the bailer which is appropriate to project requirements. Typically, small gauge nylon rope is used, although stainless-steel cable may be used when samples will be analyzed to very low detection limits. The rope or cable should be new and clean. Do not use materials which have been used on another project, as this may result in cross contamination.

B. Consult the Project Manager to select a bailer composition which is compatible with the anticipated groundwater quality. For most applications, PVC bailers are adequate. Stainless-steel may be used where very low levels of organic compounds are of interest. Teflon bailers are available and may be requested on some projects.

C. Using a strong, non-slipping knot, such as a bowline, tie the rope or cable to the top of the bailer.

D. Lower the bailer into the well. Do not let the bailer free-fall down the well, as the device may shatter or the ball valve may become dislodged upon striking the water or the bottom of the well.

E. Raise the bailer by pulling the rope with a smooth, uniform motion. A jerky motion may open the check valve, resulting in water loss. Check the knot periodically.

Do not allow the bailer rope to drag on the ground. Place plastic sheeting on the ground to keep the rope clean if conditions are muddy, the ground surface is contaminated, or very low levels of contaminants are of interest.

**IV. DECONTAMINATION:** The equipment should be decontaminated in accordance with SOP 01-01-00.

Typically, the bailer is washed with a potable water and non-phosphate soap solution. The bailer is then rinsed with distilled water and wrapped in plastic or foil until used.

**V. TROUBLESHOOTING**

A. If the knot should come undone or the rope breaks, the bailer typically can be recovered using a weighted fishing hook tied to monofilament line.

B. When bailing turbid water, it may be necessary to rinse the ball-valve at the bottom of the bailer with distilled water if it clogs.

## **06-01-01 WATER-LEVEL MEASUREMENT IN MONITORING WELLS**

**I. SCOPE AND APPLICABILITY:** This procedure is applicable to the measurement of water levels in monitoring wells and open boreholes.

### **II. PROJECT-SPECIFIC REQUIREMENTS**

#### **A. REQUIRED READINGS:**

#### **B. APPLICABLE METHODS:**

**III. METHODOLOGY:** Water levels should always be recorded to  $\pm 0.01$  foot. Measurements should be made from a marked point on the inner casing for monitoring wells, and from the ground surface for open boreholes. Equipment should be decontaminated in accordance with SOP 01-01-00 after each measurement. The following methods may be used:

#### **A. CHALKED-TAPE METHOD**

1. Check records for historic water levels in the well, if available.
2. Rub the first five feet of a steel surveyor's chain or fiberglass tape with carpenter's chalk.
3. Lower the tape into the well until the end of the tape enters the water.
4. Record the tape footing at the wellhead to within 0.01 feet.
5. Pull the tape out of the well and read the tape footage of the water mark to within 0.01 feet. The difference between the readings is the water level.

#### **B. SOUNDING**

1. Attach a small float or hollow-bottom weight or sounder to the end of a tape measure.
2. Lower the sounder into the well and listen for the sound of the weight hitting the water surface.
3. When this is heard, pull the sounder back a few inches and redrop it by 1/4-inch increments until the sound is heard again.

4. Subsequent smaller increments of lowering the sounder will allow water-level measurements to within 0.01 feet.
5. Measure the length from the zero mark on the tape measure to the bottom of the weight. Add this value to all field measurements made with the sounder.

### **C. ELECTRIC-WATER LEVEL METER (Solinst)**

1. Turn the Solinst on by turning the knob clockwise. This knob is also the volume control. Test the Solinst to see if the battery is dead by pushing the button next to the volume knob. If the battery is charged the Solinst will emit an audible tone and the red indicator light will illuminate.
2. Lower the end of the probe into the well or borehole. The probe will cause the unit to emit the tone and illuminate the light when it contacts water.
3. Pull the probe back a few inches and lower the probe in smaller increments until the water level is measured to within 0.01 feet.
4. The water level is read directly from the Solinst tape, and already includes a correction for the length of the probe on the bottom of the tape.

**D. INTERFACE PROBE:** This is the only reliable method for wells with floating free product.

1. Push the On/Off button to turn unit on. Lower the probe into the liquid. The horn will sound a steady tone and the yellow light will illuminate when the probe contacts an oil product. Slowly raise probe until sound stops, lower until sound is heard again to refine the oil level.
2. Read the tape marking and note as the surface level of product.
3. Slowly lower the probe through the oil product, searching for the oil-water interface. When the probe reaches water the tone will switch from steady to a beeping tone and the red light will illuminate. Slowly move probe up and down to refine the oil/water interface to within 0.01 feet. Read the water level directly from the tape. The length of the probe is already considered.

**NOTE: Auto Shutoff Feature:** After approximately five minutes of power on, the unit will auto-shut off. A chirping sound will be heard, warning impending shut off. Press

<POWER ON/RENEW> to continue operation. During five minute interval, short "alive" beep is heard.

#### **IV. PRECAUTIONS AND COMMON PROBLEMS:**

1. Be sure to allow sufficient time after development, purging or pumping to allow the well to recover to static conditions.
2. Sounding may be difficult with very deep water levels or in noisy conditions because the sound is hard to hear.
3. Measurement of water levels in pumping wells or wells/boreholes with cascading water can be difficult. Installing a narrow PVC access tube inside the well casing can make obtaining accurate readings easier.
4. Free product floating on the water table depresses the natural water level. If a true water level is required, the product of the oil thickness and the oil specific gravity must be added to the oil/water interface elevation.
5. If there is no measurement mark on the well riser, add one in indelible ink.

#### **V. DOCUMENTATION**

1. Record water levels in a field notebook or Groundwater Monitoring Data Sheet (SOP 07-02-01). Be sure to record the date and time of the measurement.
2. Data should be incorporated into the Trip Report (SOP 07-02-04). Method of measurement should be reported.

#### **VI. REFERENCES:** None

## **07-01-01 MAINTAINING SAMPLE CHAIN OF CUSTODY**

**I. SCOPE AND APPLICABILITY:** This procedure is to be employed whenever samples are collected for laboratory analysis, and is designed to ensure that sample integrity is maintained. These procedures are necessary to assure that samples are defensible.

**II. PROJECT-SPECIFIC REQUIREMENTS:** None.

### **III. METHODOLOGY**

**A. SAMPLE CUSTODY:** The sampling personnel must maintain custody of the samples until they are delivered to the laboratory, at which time the laboratory takes over the custody record. A sample is considered to be in custody if:

- it is in the investigator's actual possession
- it is in view of the investigator
- it has been placed in a secure area
- a signed custody seal has been placed on the sample container such that the seal would be destroyed if the container was opened.

### **B. CUSTODY RECORD**

1. Complete a Chain-of-Custody Form for each shipping container of samples as described in SOP 07-02-02. Place the white copy of the completed form in the shipping container with the samples, as discussed in SOP 07-01-03.

2. Affix a signed custody seal to secure all samples. Seals may be placed across the lids of individual sample bottles, or on each shipping container of samples. If seals are placed on shipping containers, at least two seals must be used, and they must be placed such that the container cannot be opened without breaking the seals.

### **IV. PRECAUTIONS AND COMMON PROBLEMS**

A. It may be necessary to cover custody seals with clear postal tape to prevent them from falling off.

B. Deliver or fax a copy of the custody form to the Project Manager within 24 hours of shipping the samples so that any errors can be corrected before the laboratory begins processing the samples.

**V. DOCUMENTATION**

A. The pink copy of the Chain-of-Custody Form should be submitted to the Project Manager as soon as possible after the samples are shipped.

B. The Project Manager or a designee must review the form for completeness and correctness. Any errors should be flagged, and the laboratory should be contacted if errors could affect analysis. The reviewer should initial and date the form, then place it in the Project File.

C. Compliance or problems with custody procedures should be documented in the Trip Report (SOP 07-02-04).

## 07-02-01 GROUNDWATER MONITORING DATA SHEET

- I. SCOPE AND APPLICABILITY:** A Groundwater Monitoring Data Sheet is completed each time water samples are collected to document field data and sampling methodology.
- II. PROJECT-SPECIFIC REQUIREMENTS:** None.
- III. METHODOLOGY:** Complete the form (Exhibit 07-02-01) as samples are collected, as follows:
- a. Self explanatory
  - b. CEC project number
  - c. Names or initials of all members of the sampling team
  - d. Complete well designation
  - e. Depth to water level, reported to  $\pm 0.01$  ft. (Check measurement datum at the top of the column.)
  - f. Date and time well purging is started
  - g. Volume of water removed, in gallons
  - h. Check if well was purged to dryness
  - i. Indicate method of purging, such as submersible pump or bailer
  - j. Date and time that the actual sample was withdrawn. If sample bottles were filled at multiple, separate times, these should all be indicated.
  - k. Self explanatory (Check units for temperature.)
  - l. Unusual odors or other observations
  - m. Other atypical information, such as special handling of purge water or field problems
- IV. PRECAUTIONS AND COMMON PROBLEMS:** All information required by the form must be provided.
- V. DOCUMENTATION:** Attach the form to the Trip Report (SOP 07-02-04).
- VI. REFERENCES:** None.
