

Celebrate our natural heritage and protect native plant communities

1. Learn more about native plants.
2. Buy nursery propagated plant material.
3. Don't dig plants from the wild.
4. Protect native plant and natural area habitat.
5. Promote responsible landscaping practices.
6. Plant native and not exotic plant species.

LANDSCAPING WITH NATIVE PLANTS

PROMOTES BIODIVERSITY
and endorses a land ethic that celebrates our natural heritage

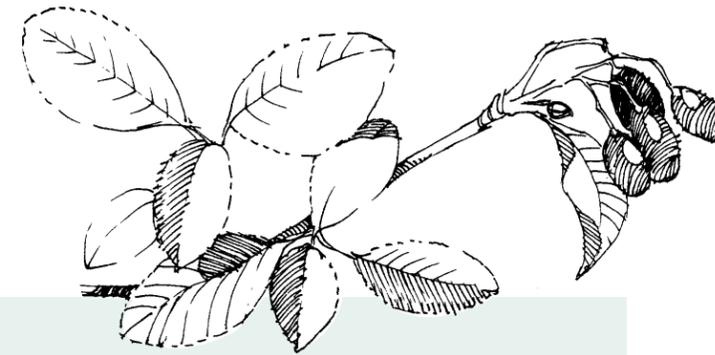

Our natural heritage

The use of native plants in landscaping is a celebration of our natural heritage and an awakening of a land ethic first expressed by Aldo Leopold more than 50 years ago.

The natural processes from which natives evolve represent the cog and wheel of a healthy ecosystem sustained by a complex web of biological diversity.

Native plants have many inherent qualities and adaptive traits that make them aesthetically pleasing, practical, and ecologically valuable for landscaping.

Using native plants contributes to the health and often the restoration of an ecosystem. Landscaping with natives in an urban setting helps restore regional character and places fewer demands on resources.

Native
species naturally occurring in a region (indigenous)

Exotic
species introduced by humans, either deliberately or accidentally (alien, non-native)

What are natives?

Natives are plants that evolved over geologic time and are distributed across the landscape largely in response to climatic episodes and adaptation to site conditions related to land formation.

Natives are generally defined as plants that occurred in North America before European settlement. This distinction is made because of the large-scale changes in the flora that have resulted since European settlement and the introduction of "exotic" plants.

Exotics are plants that are directly or indirectly, deliberately or accidentally introduced by human action. To be more precise, natives are natural elements of a regional landscape. While some species are native to North America, they may be exotic to Middle Tennessee.

Natives vs. exotics

While many exotics are harmless, others pose serious threats to biodiversity. Exotics that escape and naturalize change the floral composition of native plant communities. Exotics that invade native plant communities spread, out-compete, and displace natives. Other exotics are vectors for disease and exotic insects. Future introductions can be prevented by using native species.

Using natives also exhibits regional flora and promotes our natural heritage. Natives have often been overlooked and their aesthetic value ignored. Instead, many regions look the same because overuse of the same exotics has created a monotonous, predictable landscape.

Basics about using natives

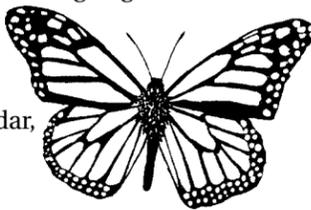

When landscaping with natives match the right plants with the right site conditions. Consider using plants that occur together in their natural habitats. Do your homework before planting; study the plants and the site condition information in this brochure. Visit a natural area and observe how plants occur and design your landscape accordingly. Buy nursery propagated plants. Remember, landscaping with natives is art imitating nature.

Benefits of natives

- Adapted to regional conditions and may require less maintenance and are cost-effective.
- Hardy, withstand extreme winter cold, do not suffer from die back.
- Environmentally friendly, require fewer pesticides and fertilizers because of natural adaptations.
- Promote biodiversity and stewardship.
- Provide food and shelter for native wildlife.
- Restore regional landscapes.
- Prevent future exotic introductions.

Natives for wildlife

Using natives in landscaping helps sustain native butterflies, moths and other beneficial insects; native birds, reptiles, mammals, and other fauna. Fall migrating birds depend on high-energy fruits from flowering dogwood and spicebush. Spring migrants feed on insects that occur on oak trees. Beech and other native trees provide nesting habitat, while Eastern red cedar, Virginia pine, and American holly provide winter cover and food.

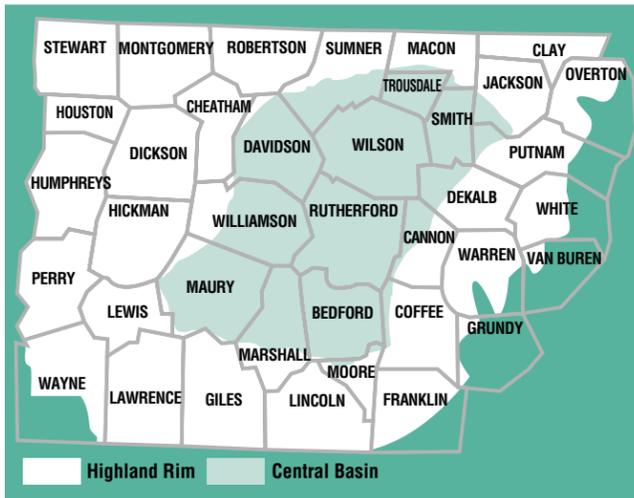

- **Don't dig plants from the wild.**
- **Buy nursery-propagated plant material.**

MIDDLE TENNESSEE

Central Basin and Highland Rim

The Central Basin and the Highland Rim are uniquely different physiographic provinces that make up Middle Tennessee. Site conditions for each respective province are determined by topography, soil pH, soil depth, aspect, availability of light, and hydrology. These site conditions support a mosaic of native plant communities.

- Dry upland sites support xeric oak-hickory forests.
- Beech, tulip poplar, basswood, and sugar maple (mixed mesophytic) forest communities occur on north-facing slopes.
- Floodplains and upland swamps support “wet feet” or hydric plants.
- Unique barrens occur in open grassy areas on the Highland Rim.
- Rare cedar glades occupy thin soil, poorly drained limestone outcrops (winter wet, summer dry habitat) in the Central Basin.

Soil pH is a distinguishing feature between the Basin and the Rim. The elliptically shaped Central Basin is underlain by Ordovician limestone and has alkaline soils, whereas much of the surrounding Highland Rim has acidic soils that are heavily leached and often occur in the resistant siliceous Fort Payne formation.

For landscaping purposes it is important to remember that plants growing in our region are specifically adapted to hydrology (moisture and dryness) and soil pH (acidity and alkalinity). Soil moisture, soil pH and light availability are important limiting factors. Matching plants to site conditions will yield the maximum benefits that natives provide.

Native plant recommendations

KEY

LIGHT
 F = full sunlight
 P = partial shade
 S = shade

SOIL MOISTURE
 H = hydric; wet, plants periodically or often inundated by water
 M = mesic; moist, adequate soil moisture retention year-round
 S = sub-xeric; moist to dry, seasonally moist, periodically dry
 X = xeric; dry & drought resistant, little moisture retention, excessively drained

SOIL pH
 B = basic; prefers limestone
 A = acidic; prefers acidic soils
 R = restricted to either B or A
